CS> STZIP is due out? aparently v2.0 has a bug that creates bad crc
CS> files for over 40K :-(

I hope to release it for the new year ! I've had report for those CRC
errors but I've been unable to reproduce them (I've only been trying for a
few days since I didn't have my Atari before).
What configuration did you use and is the same file systematically
wrongly compressed ?

2. What use is the AP_TERM message?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-01 13:48:50 UTC
From: Vincent_Partington@p15.f202.n281.z2.fidonet
Message-ID: <2b444d52@p15.f202.n281.z2.fidonet>
Source record: 41407

Hi everyone,

I had a chance to have a look at MultiTOS at a friend who is an official MultiTOS beta-tester and I was very impressed by it.
While I was there I had a look at some of the very interesting documentation that goes with it and a saw in GEM.DOC that there are some new events: WM_UNTOPPED, WM_ONTOP, AP_TERM and some others.

I thought AP_TERM was very interesting until I tried it out; I had my own program catch that event and respond appropiately by quitting, AFTER cleaning up some stuff.
But I found out that an AP_TERM message nearly never gets delivered, Mint just gives you a signal when you're supposed to quit (for example if the user deletes your process from U:\PROC\) and because my program didn't catch signals it was just terminated without getting an opportunity to clean up some things. Now I don't mind catching the signals but I was just wondering what the use of AP_TERM is if you never get it....

According to the documentation you get it when the system shuts down or when the resolution changes. However, the resolution only changes when all programs have already quit (just try changing the resolution from the desktop, you'll see what I mean) and there's no way (yet) to shut down the machine. So what use is AP_TERM??

Ta!
Vincent

4. A Bomb in the Post

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-01 22:02:35 UTC
From: cal@otter.hpl.hp.com
Message-ID: <44380001@otter.hpl.hp.com>
Source record: 41408

I have a problem which might appeal to the older Atari user. It is a bug which has been driving me nuts for years, and if I don't get a fix I'm going to fill my hard disk full of gunpowder and mail it to Atari.

First, the system. It is one of the "black brick" 520s with external power and an external floppy. It has been upgraded to 1 Mbyte. It has been completely, utterly reliable in every respect EXCEPT for the

Atari SH204 Hard Disk which I have had for several years, but rarely use because there is a bug in the system software which results in a partition being completely buggered on a regular basis. The symptom is that all the filenames become something like "zzzzzzzz.zzz", and most of the files are completely filled with garbage. I have to zero the partition to resume. It has happened on all my partitions at one time or another. It has happened three times today.

I am using the Atari supplied AHDI Hard Disk driver, dated 16th. June 1986. Is this the well known 40 folder problem? I am using an Atari supplied utility to add an additional 100 folders, and despite taking reasonable precautions to avoid encountering folders, I still get this bloody bug.

If this stirs a flicker of a memory, and you know of a fix, please let me know, and I'll donate some money to Greenpeace ;-)

5. Looking for a working version of GNU make...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-02 03:40:07 UTC
From: anneklin@acs.bu.edu
Message-ID: <105905@bu.edu>
Source record: 41409

Hey, everyone. I'm looking for a working version of GNU Make. I had a working version of 3.62 at one time, but I think I compiled it myself, and for whatever reason, I can't seem to recreate the conditions which allowed me to build it.

The problems I have been seeing all relate to the new makefile for GNULIB (using Howard Chu's "unified" makefile scheme), and the ones I made for the GEM and C++ librarues from that template.

If I execute Make, with MiNT 0.95 and Gulam, with SHELL=c:\bin\ash.ttp in the makefile, and give it the parameter lblong, I get three things:

1) make executes 'make clean'
2) make executes 'rm -f' several times for several sets of files.
3) make executes 'make install TARGET="long-int baserel"'

Then I get a bus error.

If I try to use tcsh as my shell, I still get the same behavior. I've taken everything but MiNT out of \AUTO, as I need that for ash to be able to fork.

Any suggestions?

Later,

It works exactly as defined and does make sense. ALL program active when
changing the resolution from the desktop have to know AP_TERM. If you are
interested in it you should register yourself as developer. You can't expect
to get details concerning MTOS in the net because of non-disclosure
agreements.

>yourself but of course TOS should do that for you.

The 20 Malloc per program limit was removed a long time ago (certainly
it was gone in TOS 1.4). And, of course, MiNT has no such limit.

Managing memory "yourself" (i.e. by asking the operating system for
large blocks of memory, and having your own malloc() function split
those large blocks up for your program) is still a good idea, for 2
reasons:

(1) it's faster (entering the OS is always going to add overhead), and
(2) it may save memory: on a virtual memory or memory protected system,
the OS must manage memory in pages; so even if you ask for 1 byte,
an entire page (4K or 8K) must be used by the OS for your block
of memory.

Most libraries' malloc() functions will handle everything automatically,
allocating memory in large chunks (4K or 8K or even 32K) from the OS
and then splitting those chunks up as necessary. See for example the
MiNT or GNU C library malloc()/sbrk() code. All the programmer has to
remember is to use the standard C malloc()/free() functions instead
of the Atari specific Malloc()/Mfree() functions.

You've got a point there. So how do I become a registered developer without
having a big firm behind me? Do I just write a letter to Atari Benelux (for
Holland, where I live) and ask them?

all the developers out there who are registered with Atari have signed a
"Non Disclosure Agreement" (as I have, too), so you'll have to wait for answers
until MTOS is finished and available to the public.
The behaviour of the new stuff in MTOS is still subject to change, since MTOS
itself is in beta state.

sorry, but it is impossible for an atari to read a disk formated on an amiga.
The reason is the format used by the amiga: gcr coding, different number of
sectors on different tracks. Ask the amiga owner to copy the data to an
ms-dos disk. The amiga owner will need kickstart 2.0 or one of the dos disk
converters (crossdos, dos-to-dos) to do this....

The MegaFile 30 and 60 are exactly same except for the capacity of the disk
itself. It's news to me that a megafile 30 is unreliable, and I've owned one
for several years. (I sold it when I got a MEGA STe with an internal drive.)

As for the complaints in the original message, they sound to me like some sort
of resonance of the casing, and I wouldn't worry too much about it.

Hello!

I'm seeking for a command line driven tool to compress, or to use the name Atari's checkdisk3 is using, to clean up directories. It is not necessary that this tool compress a whole disk or partion.

The program should clean up a single directory or a whole path and, perhaps as an additional feature, should perfom a mediachange. BGMs and other types of non-GEM but from GEMDOS used partition must be no obstacle.

Yes, and of course the program must be MiNT-friendly and has to be able to work as an background process.

All hints are very wellcomed.

As far as I know there's no chance of reading or writing to/from an Amiga disk. Guess what? It's those custom chips. Unlike the rest of the civilised world (Mac's excepted) Amiga Corp didn't use a Western Digital chip, so there's not much chance of it working.

That's what I found anyway, 'cause I tried writing a program like it a year or so ago. I did successfully read Archimedes disks, and if anyone wants the source to it (in GFA3 and m/c) they're welcome to it after the start of our Spring term (11th Jan).

David.

So .sig for 1993 yet!

>So .sig for 1993 yet!

But the Amiga can read and write PC-disks (720 KB) using CrossDos (in 2.1 system
software) or using MultiDos or MessyDos (later two are public domain).
If memory serves right, the Atari ST can read MS-Dos (PC) disks.

The Amiga Disk format uses 11 (22 with High Density drives) sectors per track
instead of the 9 (18) of a PC. This is because the Amiga usually writes
complete tracks and thus does not need more than one inter sector gap (PC's
have gaps between all sectors) but it can insert gaps if desired and go to 9
sectors per track.

9*2*80=1440 blocks = 1440 *512/1024 = 720 KB
11*2*80=1760 blocks = 1760 *512/1024 = 880 KB

for high density disks replace 9/11 with 18/22 for capacities of 1440KB/1760KB

Michael Forget wrote about his Megafile making noises..

There are two sources of such noises normally.. the first is a
"head crash" where the flying read/write heads make contact
with the spinning disk and gouge the surface of the disk.
The material scraped from the surface will cause secondary
crashes until the heads and surfaces are destroyed. The noise
from a head crash will usually be a scraping and grinding sound.

You do NOT want this to happen..! :)

The second source of noise is a "ground strap" which serves to bleed
off static electricity which would otherwise build up on the spinning
platters. The place where this strap contacts the end of the axle
tends to wear, allowing the strap to vibrate and make noises.

This is not destructive, only annoying.

There are ways to dampen the vibrations of the ground strap, but they
require disassembly of the case, and possibly removing the pc board
on the bottom of the hard drive itself. If you can get to it, a small
blob of silicone sealer on the *outside* of the strap will often cure
the noises.

(A third source of noise could be failing bearings in the cooling fan,
but it would be pretty obvious where that noise was coming from.)

In the case of a head crash, you'd know it very soon, as the drive would
become unreadable, and there would be many errors.

From the description of the symptoms, and especially because the noise
changes with the orientation of the drive, it sounds like the ground
strap to me...

To: cal@otter.hpl.hp.com
Subject: Re: A Bomb in the Post

Sounds similar to the 40 folder bug, but rebooting should "fix" things momentarily if it IS the 40 folder bug.

Sounds like a failing PS or perhaps chip.... (I had a chip get zapped in my MEGA that caused similar behaviour. If the same chip had oxidation (can't spell corosion...) on a pin and needed reseating, similar symptoms would result!)

Don't despair.... sounds like a $20 problem to me!

Hello,

I am having difficulty with chdir() is Sozobon 1.33i (Heat N
Serve). It won't change drives. According to the dlibs text file,
chdir() will change the drive if a drive letter is given to it. I assume
this means that if I enter "d:\telecomm" for a string, it will (with
the proper end slashes added.) change the current drive to D: and then
change the directory to \telecomm. The problem is, it does not do this.
I'm only trying to implement a simple cd command for a mini TOS shell
and I've got most of the other commands finished. This one, that should
be easy, doesn't want to work. Any help would be great or if you have a
working cd command implemented, I'd love to see your code.

[stuff deleted]

Clean up/defragmentate a partition in the background??? Sounds a bit insane to me. :-) Even if it would lock the whole partition there are always BADLY written programs that can circumvent the lock. I wouldn't want to defragment anything if I didn't get progress-reports either, and if you're running in the background the best you will get is output to a file (a background process can't write to the tty as far as I know).

Oh, and to just clean up/defragmentate a single path on a partition would probably be useless since programs from other paths would split your path into small pieces anyway. :-(

My advice: Boot GEM and run CHKDSK3. Then go and take a leak or something and come back to a clean and defragmentated partition. :-)

|>
|> for high density disks replace 9/11 with 18/22 for capacities of 1440KB/1760KB

Hmm. Now I come to think about it again it might be possible to read Amiga disks, it's just that it'd take one helluva long time. Amigas have links between all their sectors, and so Amiga sectors don't hold 512 bytes of data, only 478 (I think that's the right number) and the rest is link data.

I don't know whether the blocks are actually 478 bytes and the link data is in the inter-sector gap, or whether the blocks are 512 and KickStart decodes it. If it's the former then you can forget the idea of reading it 'cause WDs don't like odd sector sizes. You could read in the whole track (gaps and all) and decode it yourself (lurvly!)...

The point is that the FDC controller software in the Abacus DiskDrives Inside and Out book seems to show that the FDC can't identify sectors of any size on the disk. And that's a problem.

It's all from memory, so if someone knows for real then please join in!

David.

Hmm. a sig.
Nah.

I certainly like the idea of structs in GFABASIC... I've long hoped they'd include something like it.
Just out of interest, what do you lot out there use for writing programs? The Partnership I'm in is about to release a Shareware collection of little boot programs and utilities and I'd say it's about 60% GFA, 30% 68000 and 10% C. But that's 'cause we like GFA3.5 and I (at least) have never really got the patience to use Lattice 3.

Is Lattice 5.5 worth it? #150 (UK) is an awfully big amount of money for an Atari user! (Esp. one saving up for a Falcon :)).

David.

If it uses the GEMDOS setpath() call it won't change the drive. GEMDOS keeps a current path for every drive, so you probably need to chdir() and then chdrive() (I haven't used C much so I don't know), or the other way round.

I think.

Fclose() the file, and then re-Fopen() it.

I got TOS 2.06 to work in my 1040ST with 3 TTL chips (<$1). If anyone is interested in how to do it send me email and I send the current version of a document that I have been working on. Also, Can someone tell me how to upload to the archive?

Thanks

Ted Rossin

30. How do you write a CPX

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-04 17:04:18 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <107480010@hpfcso.FC.HP.COM>
Source record: 41434

Now that I have TOS 2.06 I have a few questions:

1. How do you write a CPX
2. What is the deal with the fast load bit people talk about.
All the programs seem to be doing the fast load thing (I have 4 Meg)
How do you disable it. Do you need to use pinhead to no fastload.
3. Should I buy Warp 9?

Thanks
Ted Rossin

> break;
> }
> } while (Fsnext() == 0);
>
> if (vol != NULL)
> return vol;
> else
> return NULL;
>}
```

I doubt it - there are several problems with this. Firstly, you set aside 8 bytes for "path", then only use 3 of them. Then (more importantly) you set path to the string "/D", where D is the drive (Note the slash is the wrong way round). Note that anyway chdir("a:\") will simply change the current directory on drive A: to the root, not change to drive A:.
Next you call Fsfirst without first setting the DTA - by default this is over the area where the command line is stored. Then you assume that Fsfirst has found something when it might not have done. Next you call

Fgetdta inside a loop where the DTA address never changes and check that the attribute really is FA_LABEL, which it always will be (this is not a bug - just a waste of time). You then call Fsnext to find the next file with the FA_LABEL - even if for some reason there were two labels on the disk the "break" would mean the second one would be ignored. Finally "if (vol!=NULL) return vol; else return NULL;" can be reduced to "return vol".
Sorry to be so negative, but here's how I'd do it:

```
char *getvol(char drive)
{
_DTA dta;
static char search[]="X:\\*.*";

*search=drive;
Fsetdta(&dta);
if (!Fsfirst(search, FA_LABEL))
return strdup(dta.dta_name);
return NULL;
}
```

Two backslashes are required in "search" because backslash is used as an escape character in C - "X:*.*" will be interpreted as "X:*.*" or maybe "X:.*", I can't remember which. Note that the above this changes the DTA's address - it might be a good idea to save it at the beginning and restore it afterwards.

>Now, what I'd like to do is be able to change an existing label. Or, if one >doesn't exist, I'd like to create it.

Simple - as you know, the volume label is simply a file with the attribute FA_LABEL, so to change it you simply delete this file and create a new one with the name you require. The following sets the label of the specified drive to "new_vol" (or insures there is no volume label if new_vol is NULL and returns the old label (or NULL if there was previously none).

```
char *setvol(char drive, char *new_vol)
{
char *old_vol;

if (old_vol=getvol(drive))
Dremove(old_vol);
if (new_vol)
Dclose(Dcreat(FA_LABEL, new_vol));
return old_vol;
}
```

It is more than possible that I have made a mistake somewhere (eg. Dremove may be called something else, and Dcreat may take it's arguments in the opposite order) as I have not tested either of the above. However, this should at least give you the general idea.

Do you know of any librarys that will Mfree() blocks once all parts of them
have been free()ed though? If none do then we have know choice but to use
Malloc() directly in a multi-tasking system or else the user will have to
shut down applications and restart them to free "lost" memory.
In any case if you are allocating a large block of memory it is better in
every way to use Malloc().

I've never heard of a chdir() function with this behavior (I had to write another function to do what you describe) and this is not how a normal cd command behaves anyway. Perhaps you read the documentation wrong.
Note that if you write a separate program that changes the directory it will appear to do nothing because when you run a program the current directory is first saved and then restored after the program has run (the same with the rest of the environment).

The outlined strategy may work, but I'm not so sure it's a good idea.
If I were going to port a C to the Mac, I'd do GNU C, and port it "the
right way". Sure it's huge, but as you said, memory on the Mac isn't
such a big deal anymore. The smallest Mac you can buy nowadays is 2
Mbytes, more than adequate for GCC. My reasons for this assessment
follow:

* GCC is a full (even extended) ANSI C language, and was carefully
written to conform to the ANSI standard. Since ANSI C is the
standard, programs, especially ones written in the future, are liable
to not compile on K&R compilers. I write all my code in ANSI C,
because it's a big improvement over K&R and it makes my life easier.

* GCC is a very good compiler. GCC version 2 optimizes as well as the
best commercial optimizing compilers (much better than the compiler
distributed with SPARCstations only 2 years ago, and much better than
any other Atari compiler).

* GCC runs on many systems, including a zillion flavors of UNIX,
MS-DOS, and the Atari ST. Therefore, a program written in GCC is more
likely to work on other systems than a program developed with _any_
other C compiler (like, say, SUN's compiler, or Mark Williams C). A program
written with one GCC need only be compiled by another GCC to provide an
easy port. Potential problems of hidden compiler incompatibilities
between systems are eliminated.

* GCC is backed by the Free Software Foundation. This is not a
program which will lose support when one or two people taking care of

it decide to do something else. (I know. I wrote The Vault, and now that I don't feel like supporting it anymore, no one is supporting it.) The FSF, headed by Richard Stallman, under the guise of the GNU project, is dedicated to bringing a full UNIX-compatible system to everyone, and GCC is part of that. (Incidentally, while the FSF tries to write programs which compile with other people's C compilers, the GNU project compiles most reliably with GCC. This includes re-makes of programs like make, yacc, lex, sh, to name a few. GNU project programs not part of standard UNIX include a full PostScript interpreter.)

* Finally, the most compelling reason is that I think that GCC would be the easiest to port! GCC was written in a modular way, so that it can be ported to any system, running any instruction set. What porting it consists of is describing, in GCC's machine-description language, the properties of your computer's instruction set. The code generators and optimizers use this information to generate code for your computer. Adding a new machine description to GCC does does not eliminate the possibilities for GCC to generate code for other machines. (This means that GCC can be easily used as a cross-compiler --- build the standard distribution to run on one system, but to produce code for another.) Since someone has already described the 68000 instruction set to GCC, you would just have to modify the description, to make it work with the Mac quirks (like the special status of A5). To encourage people to port GCC, Richard Stallman (author of GCC) has written a 190-page manual describing in detail how to port GCC. I don't believe any other program comes with such carefully written porting instructions.

* And last but not least, GCC is not just a C compiler. It consists of a front end, to parse programs, and a back end, to generate code. GCC version 2 includes C++. The FSF is working on implementations of FORTRAN and other languages, all which use the GCC back end. So the effort into porting GCC results in two languages ported today and potentially many in the future.

I hope that GCC will see the light of day on the Mac. Since the Mac is not really a hacker's computer, few people have shown an interest in porting it. But I think a lot of people would benefit from a port, given the large numbers of Mac users.

I resent the claim that the Mac is "not really a hacker's computer"!

Tell me, on what other machine would a hack like Wild Magic be possible?

Lawrence
been hacking Macs almost as long as he's been hacking VAXes.

Major problem with GCC and the Macintosh -- the Free Software Foundation refuses to have anything to do with a port to this series of machines due to the stance of Apple Computer's legal department with regard to things like "Look and Feel".

You may very well port GCC, just don't expect your work to be incorporated or supported in any way by the FSF.

43. A Tail of 24 Bombs and a TT.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-05 09:02:43 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1993Jan05.090243.35649@bas-a.bcc.ac.uk>
Source record: 41249

The story so far....

Over Christmas I was running my TT as a multi-user system (as I always do :-)) using my old 520ST as a terminal on the serial2 port, when all of a sudden the machine locked up. I rebooted the machine and as soon as the getty process accessed the serial2 port the machine locked up again.

After some investigation I found that under MiNT (0.98, no memory protection) the system would either go into a recursive bus error or halt as soon as either of the two serial ports which use the Zilog SCC chip were sent data. About two characters of the data would actually appear on the serial port before the lock-up, however.

Under TOS (3.05) attempting to print to either of the SCC serial ports caused 24 bombs and the current disk drive to be accessed! The same would happen if the RTS line on the serial2 port was toggled. This happens both on a "clean" machine and one with serpatch2 installed.

So.... What I would like to know from people in the know is...

Could a fried SCC chip cause this fault?

Steve

PS. The other two serial ports work fine.

The problem here is that you have to do menu_bar before the menu is drawn
on the screen (at startup), and it is not documented whether the AES does
make a copy of the menu tree or not (in all existing versions there is no
such thing, at least on the ST), but a networking AES will probably do so,
so before you would then see the changed menu, you would have to do a
menu_bar again, so use the documented way with menu_icheck.

46. Process memory usage in MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-05 11:30:36 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2b497414@p12.f202.n281.z2.fidonet>
Source record: 41244

Hi!

For MultiTos, I want to make a graphical representation of the amount of memory and the kind of memory (global, private, etc) a process uses, much as the list you get when pressing CNTR-ALT-F9 and F10 in MiNT.
Moreover I also would like to know where these chunks are located in memory. What I need to know is which functions to use in order to get this information. I could use the process' header flags and the information contained in the PROC structure, but this still doesn't say anything about what kind of memory a process may have Malloced during execution and where is has Malloced it. Or is this only possible from within the kernel itself?

Anyone can help?

Greetings... - Jan -

I've downloaded a version of GCC from terminator.cc.umich.edu
one year later, and I've finally decided to install it on my
STe, it's a 1040 upgraded to 4 Megs. I unfortunaly don't have
the documentation.zoo file (missed ?). I use the Gulam shell,
followed the "README" instructions but still can't compile
a single "printf("Hello world\n");" program. A compile
command gives me a "-1 exit command".

It seems that the terminator.cc.umich.edu don't have anymore
atari programs. Can anyone give me another atari server address?

Thanks.

P.S :
Good year !!

J R Evans (ngse18@castle.ed.ac.uk) proposes to port Sozobon C to the Mac:

bobf@flint.geology.yale.edu (Bob Fischer) writes:

>If I were going to port a C to the Mac, I'd do GNU C, and port it "the >right way".

...

>* GCC is a full (even extended) ANSI C language, ...

>* GCC is a very good compiler. ...

True; the 2.* versions are outstanding.

>* GCC runs on many systems

Everything I know of *except the Mac*.

>* GCC is backed by the Free Software Foundation.

However, a Mac port would get no support, and a lot of flames, from the FSF. FSF expressly (and loudly) objects to Macs because of the look-and-feel lawsuit. I personally think their stance is perverse (Leninists deny the efficacy of the market, too, and look where it got them).

So don't expect any help from FSF if you mention a Mac.

On the other hand, gcc has been ported to a/ux, so FSF's objections to Macs are not an insuperable hurdle.

>* Finally, the most compelling reason is that I think that GCC would >be the easiest to port! GCC was written in a modular way, so that it >can be ported to any system, running any instruction set.

>... Since someone has already described the >68000 instruction set to GCC, you would just have to modify the >description, to make it work with the Mac quirks (like the special >status of A5).

Indeed, you could start with the diffs for the a/ux port, which are available at wuarchive.wustl.edu in systems/aux/gnu. Note that you'd have to work around a number of nice unix features that MacOS lacks. However, if gcc can be ported to something as braindead as ms/dos or as Byzantine as vms, it has to be portable to Macs.

You'd have to build a new set of libraries, or figure out how to link the MPW libs (and make users buy the MPW libs). If you have Think C, you might be able to use the source that comes with it, although I doubt Symantec would let you distribute their source or an object file built from their source.

There is gnu source for a standard C library. Although it's for a unix-based system, much of it is in (relatively) portable C and I believe there is m68k-specific code. Of course, you'd have to roll your own system-specific code, like memory allocation and stdio.

You also have to figure out how to make MacOS system calls. They use a different (Pascalish) calling sequence. You've got to tell the compiler how to set up the calls, and warn it with a "pascal" (or similar) keyword.

Of course, you'd have to build or figure out how to link a library if you ported any compiler, not just gcc.

> To encourage people to port GCC, Richard Stallman
>(author of GCC) has written a 190-page manual describing in detail how
>to port GCC. I don't believe any other program comes with such
>carefully written porting instructions.

A very nice book on practical compiler theory. Unfortunately (unless I'm out of date), the manual is not up to date. The latest version of the manual describes version 1.38, I think; the current version of the compiler is 2.3. Because the basic theory of the compiler hasn't changed, it should be adequate, though.

> I think this is an Atari virus.
>
>

You're right, it is an Atari Virus.
Boot with CLEAN disks and using a disk utility, check the header
on the disk. (track 00, sector 00, side 0)
If it isn't 00, then it has a jump instruction (60 I think).
This means the disk runs something before going to the AUTO folder
(or whatever).
CAUTION: some commercial disks have this jump intruction.
DON'T mess with it if you don't know what you're doing.

If it has data, change the jump instruction to 00 00.
This will stop the disk from running the virus.
You can now safely remove your data and format the little bugger.
Make sure you check your disks for it - it may have spread.
Best thing is to use a virus killer as this will recognise a virus
from a commercial disk.

Best of luck.

Antony,

It probably would be pretty simple to customize the m68k description to
support the Mac. Especially given that the Atari ST port now also uses
a global data pointer (I chose a4 instead of a5; TOS clobbers a5 during
a Supexec call). However, I don't see any reason to undertake this port.
What's the ultimate purpose of this effort, just to have a freeware C
compiler on the Mac?

From: pyr579@oz.plymouth.edu
Message-ID: <1993Jan6.023352.7886@oz.plymouth.edu>
Source record: 41265

Hello,

I recently made a post concerning the chdir() command in
Sozobon C 1.33i and because I made a slight error in my reading of
the docs I mostly received responses telling me that I was mistaken.
I do not mean to complain, and thanks to those who did try to help,
but wouldn't it have been just as easy to tell me how to change the
drive rather than simply informing me that I wasn't using the
chdir() command correctly? OK, anyways, can someone please
tell me, or show me code in which the current drive is changed?
I only really have the dlibs text and Cmanship Complete to work
with, neither of which have this information. Even if you do
not use Sozobon, but know how to change the drive, please
respond, Sozobon is suppossed to be Alycon compatible, and I
assume there is a GEMDOS convention for doing this task.

Stephan

The latest version of Warp 9 from Codehead Software encorporates Extend-O-Save, which enables you to load different screen saver modules. If you have programming experience, you can create your own modules.

I am looking for a way to make the keyboard processor handling the key repeat instead of the main processor. Is there anybody on the net who has ever did such a thing. The problem with the keyboard is that there is (as far as I know) no documentation. Even the german 'Profibuch' has no detailed info.

Thanks, Leo. (Email: leo@ahwau.ahold.nl)

Yes, MiNT saves a private copy of the logical screen pointer for each
process. This was already mentioned when this thread began a month or so
ago...

67. Short flashy STOS routines required

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-06 14:03:06 UTC
From: evilandi@vnet.ibm.com
Message-ID: <19930106.060302.212@almaden.ibm.com>
Source record: 41272
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I would like to gather any short (ie. less than 10 lines) STOS basic routines which create special effects- visual or audio. You know, those quirky little lines of code which you knock together, and then can find absolutely no use for.

The routines are needed for my very last ST game, as I intend to get myself a Falcon ASAP. After a long and somewhat distorted discussion with two game magazine reviewer friends at The Raven Inn, Bridgnorth (where girls are real girls and boys are real girls, too), we came up with the concept for the WORST game EVER...

PRO INTERNATIONAL WHELK SIMULATOR 2000 PLUS ("SimWhelk" for short)

In order to compensate for the inevitably limited nature of the actual gameplay (aim of the game: not to fall off the rock), much of the program will be given over to a demo.

This game will be released either through Budgie UK licenceware or as Public Domain sometime before autumn, and will be written in STOS.

Contributions on this forum or direct by email please (preferably both!). Cheers in advance for anyone who contributes; you will get a heavy mention in the scroller!

From: rossin@hpfcso.FC.HP.COM
Message-ID: <107480013@hpfcso.FC.HP.COM>
Source record: 41288

Instead of using:

```
fprintf(fp,"Life is hell\n"); /* Carriage return and Line feed */
```

Try using:

```
fprinf(fp,"Life makes my head hurt\r"); /* Carriage return */
```

If I remember the reason that you are seeing the control M is because you opened the file up in binary mode ("wb"). If you were playing in ASCII mode ("w"), then the \n would generate the output that you would like.

I hope this does the trick

Ted.

>Do you know of any librarys that will Mfree() blocks once all parts of them
>have been free()ed though? If none do then we have know choice but to use
>Malloc() directly in a multi-tasking system or else the user will have to
>shut down applications and restart them to free "lost" memory.

Yes, some libraries do Mfree() blocks. Most do not. There are advantages
and disadvantages both ways (the advantage of *not* freeing the memory
is speed; if your program needs to malloc() again and the block *is*
freed, then there is an overhead of 2 system calls (Mfree and then another
Malloc).

It is possible that a program will need to do a very large malloc(), free
the memory, and then never need that much memory again. In this case
there could be "lost" memory. I still recommend using your C library
malloc() function, though, because this kind of situation is relatively
rare (and easily special-cased around, i.e. you can use Malloc/Mfree
for specific large blocks of memory that you know you will never need
again).

Programs that use Malloc and Mfree for general purpose memory management
(i.e. that have lots of calls like "foo = Malloc(100L)") are already
slower than they need to be, and will definitely consume far more
memory than necessary under memory protection/virtual memory versions
of MultiTOS or TOS.

Finally, the other advantage of malloc() and free() is portability;
these are standard C functions and so are available in every library
and on every platform, not just the Atari. (I know, that's often not
a concern if you're only writing for the Atari ST, but it never hurts
to make your software easy to port to other machines or operating
systems.)

Eric Smith ersmith@netcom.com
Opinions expressed above are my own; Atari has their own opinions, I'm sure.

75. Signum 2 Fonts

76. Floppy drive dead

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-07 01:01:11 UTC
From: lchd_ss@uhura.cc.rochester.edu
Message-ID: <1993Jan7.010111.18496@galileo.cc.rochester.edu>
Source record: 41278

Hi, my external floppy drive SF314 stopped working 2 days ago.
This was what happned.
I tried to format a new HD disk into 720K from the desktop. It went fine
until the pyrosave scrren saver come out and the computer crash with
2 bombs (or maybe 3, I don;t remember). Then I rebooted the
computer but this time the disk can't read any of my disk anymore.
The desktop still come out after a while but when I tried to format
any disk, the drive will try to write but never proceed further than
then 1st sector (the bar doesn't move on the scrreen). So, I clean
the drive with a floppy drive cleaner (disk type) and try to read again
but it never does anymore and what I get was the normal mesasage saying
"please use the right kind of floppy or make sure the hard drive is connected
properly...."

So, can someone tell me if the drive is dead?
I don';t have another drive to test if this is because of the compuyter
itself. It's a 520ST so it doesn't have an internal drive.
If the drive is dead, where can I get a replacement drive?
Can I used any drive for PC to put it into the case?

Thanks

...
Ling Cherd

Your Syquest drive seems to be configured to send a UNIT ATTENTION message
after power-on. This collides with the first read request issued by TOS.
You might need to reconfigure your drive with some tool; maybe the
BOOTFIX program on your ICD disk already supports the Syquest drives.
If not, you should call ICD.

(I can only speak for the Turbo/Pure C stuff.)

The problem with distributing mntlib binaries for Turbo/Pure C is that these
binaries have the math library of the compiler linked in which is
copyright Borland/Pure Software. That means that the binaries are NOT free
while the source code is.

It should be faily easy to make and distribute a version of the binaries
without the math stuff, and let the user link the math library into mntlib.
However, I haven't had yet the time to set up project files for this etc.
Also, you are the first one who demands on this.

As there seems to be interest for a compiled version of mntlib for Turbo/Pure,
I'll provide one soon (at least for the next mntlib patchlevel).

>extra characters what should I do to get rid of them???

The problem you have encountered is that Unix treats all files alike while
DOS, TOS etc do not. In Unix the open is fopen(filename,mode) where mode is
a char * of "a","r","w","r+","w+","a+". In TOS these are for text files with
CRLF being converted to LF on input and LF being converted to CRLF on output.
Note CR is ^M.
To switch this off you need to open the file in binary mode. These modes
are "ab","rb","wb","rb+","wb+","ab+". The format "r+b" etc is also acceptable.

NOTE for developers:
There is nothing stopping you using these binary formats in Unix. Any decent
implementation will recognize them. They obviously will have no effect but
its then easy to port to DOS-type environments.

Source record: 41289

I have recently purchased the ATSpeed 8Mhz emulator for intended use on my STE,
at the time the guy behind the counter said he only had the new STE adapter
with room for the new TOS chips on him (of which were extra), he said the normal adapter
was at home and he would simply post it on!

Here I am 8 weeks later, still waiting after phoneing 3 times!!.

Now, apprently the plain adapter is sold seperatly.

So, what really is the situation ? Surely everything would come complete ?

Excuse my American ignorance if these are silly questions:

1. Isn't c't a (hobbiest) magazine?
2. Is your SCSI Adapter (from c't) built from a published schematic,
a kit, or what?
3. If homebrewed from a published schematic, how can I get the
plans? I expect that I have zero access to old issues of c't.

Thanks in advance.

85. UNIX/Terminal Programs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-07 14:30:34 UTC
From: marco@sys6626.bison.mb.ca
Message-ID: <NTg1wB1w165w@sys6626.bison.mb.ca>
Source record: 41293

Thanks to all of you that responded to my request for info reagarding terminal programs and UNIX. I found many of you suggested UniTerm, which I will certainly have to look into. The main thing I was looking for was inproved emulation modes. Flash is OK, but it's not perfect. Are UniTerm's emulation modes more UNIX-compatible?

Thanks.

Just a bit more patience. I've _finally_ finished the Sozobon port, and
as soon as I can fight through the throngs and actually get to
atari.archive, I'll upload it.

And thanks to lucky timing, I just did it. Look for the file
mnthlb25.zoo in ~atari/New, soon (presumably) to be moved to
~atari/Mint.

This package includes updated versions of make and ar, included from the
1.40i beta release with Ian's blessing. These new versions have full
ARGV support, which means they are more friendly with shells and accept
up to 255 arguments per command line. If you use Sozobon C at all, I
recommend grabbing the package, if only for these two files.

Seems like it would almost be easier to convince Sozobon to produce
PC-relative, base-relative code.

Another possibility is a pseudo-relocator post-processor that takes the
object file output and transmogrifies absolute addressing modes to
PC/base-relative. The result could presumably be dropped into a CODE
resource and treated just like normal Mac code.

Source record: 41296

Uniterm isn't particularly "more UNIX compatible"; it is specifically
"more VT100 compatible." (or VT102 or VT200, as you prefer)

Most of the terminal programs that CLAIM to be VT100 compatible aren't
terribly compatible. If you compare them to a REAL VT100 terminal,
you'll find some differences.

The UNIX "termcap" system allows you to hook almost ANYTHING up, and
use MOST of its capabilities.

If you "lie" about which terminal you're using, termcap won't know
that, and it'll happily send control sequences to the terminal that
your terminal (or terminal emulator) can't handle.

When you use Uniterm, there aren't any "lies". There are a few ways
in which it doesn't conform with a "real" VT100; it's mostly in
dealing with special commands for creating customized character sets.
That's something that termcap doesn't know about, or use.

In principle, you should be able to write termcap entries for any
particular terminal/terminal emulator, and if it's customized well
enough, it should work perfectly. That's something I don't feel like
getting into.

|
|Port of gcc to A/UX does not indicate that the situation is so
|"vehement". You should not expect any support from FSF and you should
|not bother them with bug reports but this is not so much different
|then on Atari.

Right. The FSF, with their boycott, is merely NOT providing any support
for Apple-based machines. It does not mean we can't port it; in fact, if
you really disagree with FSF the best thing you can do is port more of
their software. There is certainly nothing illegal about it, and if the
FSF dared think of punishing a user for porting to macs, they would
instantly become hypocrites.

When I ported bison and flex, bison had some stupid code constructs that
I complained about in gnu.misc.discuss. This led to a brief email dis-
cussion with Richard Stallman, and he essentially wrote to me (in more
polite words) "If you have changes, we'll take them. If they are for
the mac, forget it. Bug fixes are always welcome." Bug reports here
would mean platform-independent bugs (algorithmic bugs) and not problems
found when trying to compile the thing under THINK C.

One more thing to everybody who has followed up in this entire thread.
If you haven't read the files associated with the GNU project, please
get them and read them. Two of the files are COPYING (the copyleft)
and the GNU Manifesto(named MANIFESTO, I believe). These files come
with every software distribution and I think are available via anon ftp
from prep.ai.mit.edu (or gnu.ai.mit.edu). Before posting next time,
please take time to read through these files and any others you find
that I've left out.

>Can/has anybody out there produced an After Dark equivalent for the
>Atari platform (all models, all modes)?
>If not, why not?

I started a project like this about a year ago. I got a good base for it working fairly well, although I've only put together three effects for it so far. It has some little trimmings other than a screen saver also, like screen capture and 50/60Hz switcher, etc.

I stopped working on it after a while for a few reasons: I hit some apparent brick walls in trying to make it compatible with other interrupts on the system; CodeHead added Extend-O-Save to Warp 9; my available time often shrinks to nil (I'm a student); I was going to release it as shareware, and I no longer believe that would be worthwhile.

Despite these reasons, it's possible I'll dredge the thing back up and resume work, or at least do something with it. Here's some ideas of what I could do, and why I don't want to :-)

1) Start right back from where I was and get it 'marketable'.
Frankly, I don't have much enthusiasm for this project anymore, and I have some other stuff in mind that would be more useful and satisfying.

2) Release what I have now.
It's a little buggy (because of interrupt conflicts), and omni-resolution capability still needs work. It just doesn't feel finished.

3) Give the source to someone to take over.
Even though I don't feel much like working on it anymore, I also don't want to give it up to someone else.

4) Forget the whole thing.
At this point, that looks like the best alternative. But, there does seem to be a little interest out there.

So, if anyone cares, send me your ideas and arguments, and we'll see what happens. I'll need a lot of convincing, because I don't really want to do this very much :-).

Later,
Steven Ourada

P. S. I hope that last paragraph doesn't sound like something Ross Perot might say :-)

Alternatively, the call:

_binmode(1);

somewhere at the beginning of a program will cause all fopen()s to
default to binary mode (you can then force text mode with the "t"
modifier in the mode specifier.) It's much easier, (and cleaner,
IMHO) to make this one small hack than to hunt down all the file mode
arguments all over a large program.

unfortunately, this does not effect stdin/stdout/stderr (which are set in the startup code). to make them binary, you have to set a global (which at the moment escapes me, something like int default_mode). i find setting the global even easier than using binmode(). for example i have made a binary cat, od, etc.

>

Actually, in the Mint library there is a function for this called _binmode().

Quote from the source of _binmode():
* if called with TRUE, then subsequently all fopens have _IOBIN
* by default on open. This will make life much easier for
* people who have been using the Gnu lib (any my job with the compiler
* much easier too, don't have to go hunting for fopens())

In other words, _binmode(TRUE) makes sure that all calls to fopen()
automatically open files in binary mode.

Unfortunately, this doesn't solve the problem for programs that use stdout
to write (binary) results to a file, i.e. programs that simply use printf()
and rely on IO-redirection from within a shell. Many Unix programs do this
(pbmplus, cjpeg, djpeg, etc.) The problem with this is that stdout is
already open, and NOT in binary mode. There doesn't seem to be a (legal) way
to set stdout to binary mode. Still, there is a trick, but it only works with
gcc (I still use version 1.39 or so) and the MiNT library. It may NOT even work
with future versions of the MiNT libraries. OK, now for the trick:
In main(), before any output is sent to stdout, I add this to the code:

stdout -> _flag |= _IOBIN;

This sets stdout to binary mode. It relies on how the MiNT library internally
represents and deals with files. I've successfully compiled djpeg en cjepg
(version 4) with this trick without changing anything else in the code.
I also used it to compile the previous (=old) version of pbmplus.

Perhaps someone working on the MiNT library could add a function to the library that sets stdout to binary. This would make porting Unix programs somewhat easier. And it would turn this trick into a feature :-)

Marco Blom.

99. Re: Malloc (Was: Sending objc_draw to a buffer)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-08 12:59:45 UTC
From: wmtwen@rw8.urc.tue.nl
Message-ID: <wmtwen.726497985@rw8.urc.tue.nl>
Source record: 41303

Well after reading quite of lot of posts on what to use Malloc or
malloc en Mfree or mfree I am a bit confused...
I have just begun programming under GEM and am trying to write a decent
wordprocessor (Oh my god... not another wordprocessor...). Now I need
stacks of 32K each (just an arbitrary number I chose, so that the
blocks would be not too small but would not use up too much memory
either). These stacks will be used until so much has been deleted that
the last one can be freed or until the text has been closed.
At the moment I decided to use Malloc and Mfree, because these are OS
primitives and I thought that my programs would at least remain
compatible with new OS releases that have different memory allocation.
And also it seems to me that using Malloc saves a bit of memory because
the malloc function does not have to be linked.

Question:
Did I do wrong?

Erlend.

100. A Printer Question.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-08 13:33:35 UTC
From: richard@op.ph.ic.ac.uk
Message-ID: <1993Jan8.133335.16460@sol.ctr.columbia.edu>
Source record: 41304

I've recently got hold of a really old 9 pin dot matrix printer, I'm having a bit of trouble setting it up though.

The printer is a Facit 4510. It's got a parallel and serial interface, I havn't had any luck with the serial interface, but the parallel interface sort of works.

With a solder bubble shifted so that the parallel port is expecting epsom timings (as opposed to centronics timings - is this right?) I can transmit characters to the printer, and, they do actually appear on the paper, but generally there's two of each. Sometimes three. Occasionally I'm lucky and just get the one character.

The test page prints OK, so maybe things would print through the serial port. (Assuming there's a fault and it's between the parallel port and the input buffer).

Anyone had any experience with one of these beasts or some ideas on getting it working?

Thanks

Richard

101. New RSC File Format

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-08 14:00:14 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.726501614@oxygen.sys.uea.ac.uk>
Source record: 41305

I was just wondering if anyone out there had a description of the
new RSC file format. That is the one with the colour icons and without the
size limit.
I am hoping to allow use of the new resource files to store colour
icons for a program I'm writing. Unfortunately I will not just be able to
use rsrc_load to load them in as more than one file needs to be loaded. So
I do actually need the file format.
Any details would be gratefully received...
Even a description of the old format would be nice. I can't seem to find the
one I used to have.

Reply by EMAIL please...

Thanks in advance,
Steve Sowerby.

102. TT VME Interrupt help needed!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-08 14:19:43 UTC
From: tony@microware.co.uk
Message-ID: <1313@mwuk.UUCP>
Source record: 41306

Hi Folks,

I wonder if any TT people out there can help me?

I am writing a device driver to run under OS-9 on the TT, to talk to an Ethernet card called the Bionet VME from Biodata GmbH. The example driver from Biodata running under TOS just polls the chip, but under OS-9 I need the Ethernet to generate an interrupt. I haven't yet succeeded in doing so.

The Ethernet chip is a DP8390, and has an INT output.

Looking at the tracks on the Ethernet card, there is a connection to the *IRQ5 line, so I guess it should be possible somehow.

I was concerned that I could not see any tracks to *IACK, *IACKIN and *IACKOUT. Is the TT VME bus non-standard in some way?

The only information I have on the TT is a Field Service Manual with circuit diagrams, but no programming information. The VME *IRQ5 line appears to be called XIRQ5 and goes to the TTSCU pin /BIR5. The XIRQ5 line also gets driven by the SCC interrupt.

If the VME *IRQ5 is aserted, does the TT execute a standard IACK cycle on the VME bus? Or does the TTSCU define some sort of automatic vector?

Any relevant advice would be much appreciated - particularly from anyone familiar with the Bionet card!

Thanks in advance,

Tony.

We had the same problem with several discs on PeCe.
Sometimes it was possible to shift the date of the final dead of the disc
by about 1-2 years by ajusting the little spring in the mid of the wheel.
There is also a small piece of coal, which can be "refreshed" by using
sand paper. But be very, very carefull.

I would recommend to do this "improvements" as late as possible (will
mean: when the disc stopped working), because you can repeat the procedure
only limited times.

Not always: There are drives where this contact also is used for the motor.
Together with the noise the resistance increases and finaly the motor is
to "weak" th reach the correct speed.

105. Re: Porting UNIX Code to the ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-08 15:52:03 UTC
From: jensk@hpbbn.bbn.hp.com
Message-ID: <JENSK.93Jan8085203@hpbbrn.bbn.hp.com>
Source record: 41323

Three different solutions:

1) setenv UNIXMODE b

This will also work with the MiNT library, which supports the `b' flag.

2) Recompile the program after adding a call to binmode() at the start of
main(). You may need to give binmode() a parameter (I may also have the name
wrong).

3) If your program needs to do both binary and text I/O, recompile the program
after changing all the fopen's for the binary files:

fopen(..., "r") to fopen(..., "rb")
fopen(..., "w") to fopen(..., "wb")

Good luck,

Jens.

From: subiaagb@w350zrz.zrz.tu-berlin.de
Message-ID: <1ik905INN1au@mailgzrz.TU-Berlin.DE>
Source record: 41307

Hello,

I have a problem with the VDI routine 'load fonts'. Does the
workstation handle have to be a physical or a virtual one?
And, if it may be a virtual handle, do I need to load the fonts
for every new virtual workstation or is one time enough?

How many virtual workstations are possible? Fixed number or not?

1. The best way to find out about CPXs is to buy DocSupport II. Not that I've managed to write one... Anyone have CPX code for Lattice C?

2. TOS by default clears all unallocated RAM before running a new program so that it can guarentee(sp!) that any spare memory is all zero's
That's OK on a 520, but clearing 4Mb of memory on an 8MHz 68000 is painful to say the least.
PinHead stops TOS clearing all that space, and is compatible with MOST software. The Fastload bit with is the 28 byte header at the start of any TOS/PRG program is Atari's way of doing the same thing. Any program with this bit set won't have its memory cleared by TOS 1.4+.

3. Dunno!

David.

|> Does this mean that programs linked with the Pure C library is not free to be given away ?

No, certainly not. The linked programs are free.

The license agreement I had to sign when I registered as a Pure C owner explicitely excludes compiled programs from the Pure's/ASH's copyright.

I don't know if this applies to the compiled libraries that are shipped with the compiler too; so it's just saver not to distribute them. :-)

> At the moment I decided to use Malloc and Mfree, because these are OS
> primitives and I thought that my programs would at least remain
> compatible with new OS releases that have different memory allocation.

It's OK to use Malloc() here. You do exactly what was proposed earlier in this discussion: You allocate large chunks of memory from the system and manage them yourself.

However, malloc() and free() are of course compatible to new OS releases, too, because they internally use the OS function Malloc().

> And also it seems to me that using Malloc saves a bit of memory because
> the malloc function does not have to be linked.

malloc()'s code should not consume too much memory (less 1 K).

>Well after reading quite of lot of posts on what to use Malloc or
>malloc en Mfree or mfree I am a bit confused...

The answer is quite simple: use malloc() and free(). This has 3 advantages:

(1) It will work in accessories, if your library is sensible (most are).
The OS Malloc() function cannot be called from accessories at all.

(2) It will avoid memory wasting under newer versions of the OS (which
use the MMU and manage memory in pages) and will also avoid some
bugs in old versions of the OS (TOS 1.0 was limited to 20 Malloc
calls per process).

(3) It is faster (there is some overhead to entering the OS which can
often be avoided by the library).

Regards,
Eric

L> - Are there any differences in the DMA-Chips in the 520 and the 1040?

Nes. Yo. Perhaps :-)

There are some versions of the ST DMA chip:

The "very old" version that was able to deal with all combinations of RAM chip sizes in bank 0 and 1, e.g. 512 KB in bank 0 and 2 MB in bank 1.

A newer version, where the bigger chips had to be in bank 0.

The most recent version, where all RAM chips have to be the same size.

From: vicb@clark.edu
Message-ID: <1993Jan9.054049.806@clark.edu>
Source record: 41321

Well, the title pretty much says what I need to know.

I need the fastest method for printing text to a virtual workstation from C.

Having lots of options doesn't really matter; usually I use v_gtext for the job, but is this the fastest method? Any help or insight would be appreciated; I'm fairly ignorant on such matters. I've not had to worry about speed with VDI calls yet, as I only need one of them to be fast, and it is (thanks to the blitter); all the rest of my screen layouts only need to be done once (I'm working on a game and need the fastest way to update scores.)

Thanks in advance,
Victor Bruhn

Tony Mountifield asked about the VME implementation on the TT.

You've just discovered the joys of dealing with non-standard implementations of "standards".

The "AVME" slot on the TT is only a partial implementation of the VME standard, similar to the way the "ACSI" port was a crippled SCSI implementation.

The Atari implementation of the AVME port does *not* have any provisions for bus-mastering, which it sounds like the Ethernet card assumes is available.

The only useful cards for the TT are passive devices like graphics cards, which do not need to take control of the bus.

This leaves out a very large percentage of the "hundreds and hundreds of VME cards" we often hear about...

As Alan Pratt said, "maybe next time"...

Do you require Pure C/Turbo C to write a CPX? I was under that
impression (the _only_ CPX sample code I've ever seen was Turbo C
code)...

If it's true, Atari is just plain _stupid_, since they use Lattice
inhouse, and tonnes of ST developers would rather use GNU C or Lattice
C.

126. Curses/CRT problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-09 22:25:08 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1993Jan9.222508.13357@csi.uottawa.ca>
Source record: 41330

I've got 3 problems that are kind of troubling me right now. All of 'em have to do with text i/o, and particularly that which relates to things like termcap/curses.

By the way, I'm using GCC 2.3.1, the version that I think was ported by Howard Chu. It's the one that supports -mbaserel. I'm also using the MiNT libs version 0.25, gotten from a.a.u.e.

1: Missing BCRT0.O
I haven't really searched this one out too far:

In trying to compile stuff with -mbaserel, I get some complaints that BCRT0.O doesn't exist. CRT0.O does, as well as GCRT0.O.

Correspondingly, I haven't gotten anything compiled with -mbaserel.

I'm trying to get some of the Infocom interpreters ported. Partial success; I've got pinfo, the Portable Infocom interpreter v4.01 sort of working. I'm also trying to get the other one, that supports more versions of ZIL, working. Two problems, #2 and #3:

2: Some constants from termcap/curses:
There's some constants called stuff like:
A_BOLD, A_NORMAL, A_DIM, A_BLINK, and other such text attributes.
I can't find these strings ANYWHERE. Not in /gnu/include/*.h, not in /gnu/include/sys/*.h.

And the main I/O subroutine therefore won't compile. I couldn't find them in the Sun's /usr/include, or its subdirectories, either. The names aren't consistent with either termcap/curses naming conventions either (as far as my Ultrix manual set tells me).

Where are they supposed to be?

3: Some difficulties with stream input.

The other interpreter that IS working is only compatible with MiNT, and not TOS.

The problem is in text input. Under TOS, commands seem to get terminated as soon as I hit the FIRST character. No chance to wait until I hit <Return>. Is there some typical "why" that this would happen, and that can be easily fixed?

Under MiNT, life is rosier, but not perfect. I THINK that I've gotten the input spot located in a particular fscanf command; which SHOULD be ok. The problem right now is the unfortunate fact that I SHOULD be able to use some combination of <BackSpace/Delete> to correct typing

errors, but that it doesn't accept it. Could there by a stty that I ought to do? Or do I take out the fscanf, and put in my own function?

I'd really much rather that the programs work under BOTH MiNT and TOS. By the way, there IS an incentive to get 'em working: The "Undiscovered Treasures of Infocom" are now available on the IBM PC for about $60 per volume. Each of the two volumes has about 15-20 of the classic Infocom adventure games. Adds up to a little over $3 per game... Great deal! Unfortunately, there's no Atari version planned :-(. However, between the two interpreters I'm trying to port, it should be possible to run MOST of the games on the Atari.

Yes, it has, and you really should use it (malloc()/free()) in this case.

I have an Atari 520ST system for sale. Every thing is in great condition and has been treated with loving care. I have recently moved on to a new system and would like to find a home for my Atari. I am asking $400.00 or best offer for everything plus shipping. If you have any questions please send E-mail...

HARDWARE:

Atari 520ST
- 68000 16bit CPU at 8MHz
- 512k RAM
- RF modulator for connecting to your TV
- Atari two button mouse
- TOS operating system with GEM graphical user interface
- Two joysticks
- Connector to add two joysticks for four players

Two Atari SF354
- Single sided disk drives
- Uses 3.5" disks
- Will format to 360k

Master 3S
- Double sided disk drive
- Will format to 720k
- Teac mechanism

Rio Datel Disk Drive
- Double sided disk drive
- Will format to 720k
- Teac mechanism

Atari SMM804
- 9 pin printer
- Cable
- Paper

SOFTWARE:

All software is like new and includes manuals...

-APPLICATIONS-

Flash
Shadow
WordPerfect

-GAMES-

Advanced Dungeons & Dragons: Heroes of the Lance
Better Dead Than Alien
Alien Syndrome
Barbarian
Batman: The Caped Crusader
Dungeon Master
Chessmaster 2000
Exolon
Falcon: The F-16 Fighter Simulation
Formula 1 Grand Prix
Gauntlet
Gauntlet II
Hitchhiker's Guide to the Galaxy
King's Quest III
Leader Board
Leather Goddesses of Phobos
Leatherneck
Outrun
Hyperdome
Moon Patrol
The Pawn
Phantasie
Phantasie II
Phantasie III
Test Drive
Star Fleet I: The War Begins
Sundog
Thrust
Starglider
Star Wars
Space Quest
Star Trek: The Rebel Universe
Thunder Blade
Time Bandit
Ultima II
Exodus: Ultima III
Ultima IV: Quest of the Avatar
Plutos
Vectorball
Xevious
Uridium
Robotron: 2084
Warhawk
Wizard's Crown

OTHER:

Lots and lots of Atari ST specific magazines...

r>I'm lucky and just get the one character.

You'll have to add a TTL driver logic into the STROBE line, since the Atari ST strobe output is too weak for old printers.

133. Re: VDI 'load fonts' question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-10 16:39:00 UTC
From: Peter_Missel@k.maus.de
Message-ID: <A52792@K.maus.de>
Source record: 41337

p>I have a problem with the VDI routine 'load fonts'. Does the
p>workstation handle have to be a physical or a virtual one?

Generally spoken, use the handle of the workstation you want to use the fonts
on. For the screen, it's a virtual one, for other devices, it's physical.

p>And, if it may be a virtual handle, do I need to load the fonts
p>for every new virtual workstation or is one time enough?

You have to load them for every workstation, since resolutions will differ on
different devices.
p>
p>How many virtual workstations are possible? Fixed number or not?

No docs on this topic... You can open workstations as long as v_opnvwk()
doesn't return an error condition :-)

134. Conner HD on TT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-10 18:19:24 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2b506902@p12.f202.n281.z2.fidonet>
Source record: 41338

A few days ago, I connected a Conner RZ23L hard disk (120Mb) as the internal hard disk to a TT (TOS 3.05, probably rev. C), but that combination doesn't work as it should.

At bootup, after I pressed the space bar, the hard disk LED remains on and the system doesn't see and doesn't boot from the hard disk. Now, I have connected another SCSI hard disk through an ICD host adapter to the DMA port of the TT, and the system does see that one and boots from it. After the TT has exited the driver software (ICD 6.0.4) the LED of the Conner goes out. If I then run the driver from the desktop or relog the hard disks, the Conner is seen and mounted by the system and I can use it perfectly. I only can not boot from it, and that is just the thing I want to! I have put the terminator resistors on the HD, so that's not the problem. I also have tried various jumper settings, but they didn't help.

I have heard that various problems are known when using Conner HD on TT's, so can anyone help me out? (I heard something about removing some resistors from the TT mainboard) Or does anyone have some documentation on this Conner HD concerning the meaning of the various jumper settings??

No, of course not. The Atari developer's kit comes with CPX documentation
and sample code. I can't remember off-hand if it compiles with Lattice C
as is, but I'm sure that HiSoft could help registered Lattice C owners
out with Lattice specific CPX code.

<concerning Syquest drives>
>I always boot using a disk with a warmstart program in the AUTO folder
>(and I don't like it).

Several years ago, Tim Purves wrote a program which sold in a package called "Michtron Utilities" that would resolve the first-boot problem with Syquests (and any other SCSI drive which won't auto-boot the first time on powerup.) It was called HARDAUTO. You simply put your hard drive booter software in the AUTO folder on a floppy in drive A:, and then put HARDAUTO in there right behind it. The first time you boot you will still boot from the floppy, but HARDAUTO forces the system to look for AUTO and .ACC files on the harddrive anyway...

There's also a program called SCSIBOOT that will write a bootsector to floppy A: that issues a SCSI wakeup which takes care of the problem. Personally, I don't prefer this method since I'd rather have my VirusKiller Monitor Guard installed on my A: bootsector instead...

For some inexplicable reason, I dont have this problem anymore since I installed a Maxtor 130meg fixed drive along with my Syquest. But I also know people who use only the Syquest, and they don't have the problem at all... Go figure.

142. Falcon Monitors (?)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-11 08:50:00 UTC
From: jat@cch.coventry.ac.uk
Message-ID: <C0oLvD.Bsp@cck.coventry.ac.uk>
Source record: 41195

HELP !!!

Any monitor tec boffins out there that can answer some questions for
me ? Concerning monitors and the Falcon.

I plan to buy a Falcon later in the year, with 4Mb RAM, 88Mb HD (from
a third party surplier, cos it works out cheaper then the 64Mb package deal :-)
and a SVGA monitor.

But at the moment I have enough for the monitor, so I'd like to buy it
now and connect it up to my STe until I manage to get the Falcon.

What I need to know is what sort of monitor will I need to buy, so that
I can display all the Falcon modes upto the 768x480 'True colour'
(Over-scanned) without interlace, and still be able to use it on my STe in
Low, Med and High reses ?

(I realise that I'll have to buy a multisync switch box for my STe.)

What is the tec. defination for the above monitor, ie SVGA, XGA or
what ??? What would a PC magazine advert call this type of monitor ?

What is the differance between SVGA, Multisync, Alphasync, Panasync
etc etc or are they the same sort of thing and just trying to confuse me :-)

Any particular makes and models you can recomend would also be handy,
I'm looking at 14" less then 280 pounds types.

Many, many thanks in advance,

>
> As Alan Pratt said, "maybe next time"...

Sorry, Bob, I think you misunderstood me. The card was *designed* to go into the TT VME slot, and has working TOS software to support it. The card is definitely a VME slave only, and does not require bus mastership. What I want, however, it to discover how it can generate an interrupt (not a Bus Request), and how to handle that interrupt in the TT. The TOS software does not appear to use interrupts, but the driver I am writing is to run under OS-9, not TOS. I do know the *IRQ5 line is connected in the card.

Tony.

The same thing happened to me with a Syquest. I originally had it connected with an old Adapted mfm drive, and the Syquest would not boot directly on the first try. When I replaced the mfm drive with a Quanton 52, the Syquest would boot fine (though I immediately moved my C drive to the Quantum, as it booted faster anyway.) I found that ICD's coldboot program was about the quickest way to get started, especially after it was configured to only look for scsi id0 before starting.

> not to send the UNIT ATTENTION message ?

I'm not _quite_ sure if it can be done in software; maybe you would
have to set a jumper or exchange the controller ROMs. BTW: Old Macs
have the same problem, so maybe Syquest has a "Mac version" of their
controller firmware.

TOS 2.06 fixed this problem by making at least two read attempts
from each device on the ACSI bus, so that's another possibility
to solve the problem.

>
First of all, you need a GDOS in your system, otherwise it is very dangerous to call vst_load_fonts, so use vq_gdos to check the presence. The call has to be for every workstation (virutal or physical) for that you want to use those fonts, but the fonts will be loaded only once to save memory (at least I think so).
The maximum number of virtual workstations is depneding of the VDI you use, I know that NVDI V2.11 allows up to 128 virtual workstations, but I dont know how many the original VDI allows.

151. Falcon Video Hardware Bug

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-11 15:05:08 UTC
From: neil@cs.hw.ac.uk
Message-ID: <1993Jan11.150508.21531@cs.hw.ac.uk>
Source record: 41202

Last year, during a discussion about screen handling, I wanted to point out a major difference between the Falcon and ST video hardware but at that time the Falcon was unreleased and the NDA was binding. However a friend of mine (Hi Kevin! :-) received his production Falcon recently and it has the same problem that my pre-production unit has.

Now for the explanation ...

The video hardware in the ST, STE, MegaSTE and TT will not implement a change of video address (@ $FFFF8201,3 and D on the STE) until the vertical blank occurs but before it generates the interrupt. This means that if you were writing a game that used screen double buffering and say each game turn took a maximum of three frames, you MUST set the new screen address during the third frame, NOT afterwards during a vertical blank routine. This we already knew.

However the new video hardware on the Falcon will implement a new screen address at any time that it is not accessing video RAM. This is usually in the margins at the top and bottom of the screen. This means that programs should change the address during a vertical blank routine to avoid writing to a screen that the video hardware is currently displaying. This usually means ripples and shudders in the images since you see both old and new data at some points of the screen.

Please take this into account when writing any new graphics programs so that we can eliminate this problem and maintain compatibility across the entire range of Atari computers. This was the only incompatibility I found between the Falcon and Game Workbench.

To identify a Falcon look in the Cookie Jar for the machine cookie (_MCH). The Cookie Jar pointer is at $5A0 an it points to a list of longwords (cookie, value) the details of which I won't go into at the moment.

Possible values for _MCH are:-

$0000xxxx - ST, STF, STFM
$0001xxxx - STE (Note: In a Mega STE, xxxx will be non-zero)
$0002xxxx - TT
$0003xxxx - Falcon

As an alternative you could look at the video cookie (_VDO) which is $0003xxxx on the Falcon.

How to view the phenomenon for yourself:-
I first noticed the problem when I ran a program that allowed me to have lots of bouncing sprites on the screen. As the workload moved the screen change to the point where the video RAM was already been scanned I noticed a shudder in the sprite movement. Due to the varying workload in drawing a

non-preshifted image as it moves across the screen sometimes the change happened before screen scanning started and sometimes afterwards.
Smooth movement only happens when the change of screen address is consistantly before or after the margin.

Not long after I received my pre-production Falcon, I informed Atari UK of the problem but received no feedback which is a pity because unlike other incompatibilities with the ST which are not Atari's fault this one certainly is. As far as I know, no developers have been informed of this.

Surely thats a bad as the first sin of using Unix specific modes in the original fopen(). All you have done is introduced another restriction to portability just because you cant't be bothered to look for all the fopen() calls :-) :-) You may find you have to hunt them out anyway as to assume all fopen()'s are binary is just ONE HELL OF AN ASSUMPTION.

A friendly Unix host or MinT would help:-

grep fopen *.[ch] | lpr

I've been living with "redirection" for some time. Command shells allow you to redirect the output of a command, and even to redirect a device permanently...

Outside of a CLI, and inside of a 'C' program (Mark Williams), how do I accomplish this? Specifically, I would like to be able to redirect "con:" to "aux:" and vice versa, or redirect "aux" to the printer.

Thanks. I would appreciate any info, and code examples in assembly or preferably C. There's a brief mention of it in the Mark Williams C manual, but it's terribly unclear.

Please reply via e-mail, as I don't keep up too well on this newsgroup. I will, however, post a summary of replies to this group.

>Low, Med and High reses ?

Using the monitor on your STE in all three resolutions will limit your choices.
I'd recommend an NEC 3D, Princeton 1400 Ultra, or Sony 1302. All three are
available from different places and they'll all work on the Falcon and STE
(with a switchbox on the STE). They should be available for around $400.

To be honest though, I don't quite understand all the graphics modes of the
Falcon, and I'm not sure if these monitors will work in that 768x480
non-interlaced true-color mode that you want. The monitors will work with
the Falcon, but I'm not sure in that particular mode.

Under UNIX there is no "text mode" and "binary mode" (or maybe it's
more accurate to say that both modes are equivalent). So, when
porting UNIX code to the ST, in almost all cases it IS a valid
assumption that all I/O should be done in binary mode.

Note that I didn't reccomend that people write code from scratch using
_binmode(). Of course you should get it right the first time and use
binary mode when you want it. But the fact remains that there are
thousands of lines of code for UNIX that make assumptions about binary
mode, and it's much easier to just switch to a compatibility mode than
to waste time patching fopens() every time you want to port the latest
version of your favorite UNIX program. You're right, I can't be
bothered.

Cheers,

The GNU C compiler is a little more flexible than most, you'll need to set environment variables (almost demands a CLI approach) of GNUINC to point to the location of the include files, and GNULIB to point to the library files, and GCCEXEC to point to the prefix used for the gcc binaries that sets them apart from the standard unix ones.

For example, in the MiNT distribution kit, the following are set...

```
GCCEXEC U:/usr/bin/gcc- /* the binaries are in /usr/bin and begin with
gcc-(compiler filename) eg: gcc-cc1.ttp */
GNUINC U:/usr/include /* the location of all the include files */
GNULIB U:/usr/lib /* the location of all the libraries */

Source record: 41219

michael.smith@f842.n800.z3.fido.zeta.org.au (michael smith) writes:

>G'day again - this time I'm after anyone who has info on the layout of the
>bitplanes in the TT resolutions : most particularly TT medium.

All ST and TT resolutions are the same. For a n-bitplane resolution
(where STLow,TTMedium=4bitplanes, STMedium=2Bitplane, STHigh/TTHigh=1Bitplane,
TTLow=8bitplanes) the layout is:

word 0 word 1 word n-1
0000000000000000 0000000000000000 ... 0000000000000000

The colour of the first pixel in the top, left-hand corner of the screen is
determined by the left-most bit in the first n planes of screen memory. The
next pixel (to the right) is determined by the next bit in those bitplanes,
and so on to the 15th pixel. The 16th pixel on the screen is determined
by the left-most bit of the next n-words of screen memory.

This scheme applies for STLow, STMedium, STHigh, TTLow, TTMedium, TTHigh,
and all Falcon resolutions EXCEPT TrueColour, which is word-per-pixel.

Source record: 41221

I posted this to c.s.a.s but I guess it would be better here..

Also thanks (many) go to Scott Bingham for the src he sent.
Any more would me much appreciated.

The subject line says it all really. I have found some src (eg tip
for MiNT by Howard Chu and some Un*x stuff) but it always seems to
rely on some struct (like the one defined in xbios.h (?) which isn't
included in the new sozo mint include stuff).

So, how does one set it up for 9600- 8,N,1 or whatever..? Is there a
struct in the new Sozo libs that I missed?

I'm sorry if this is a stupid question but I'm new to programming
and I don't really have much documention.

Also, are there docs for the mint dlibs or is it a case of 'use the
source'?

Many thanks,

Greg.

>no detailed info.

The book Atari ST Internals gives information about the keyboard processor,
whether you would call it detailed is another matter, and the book is badly
written, translated and short on examples.
What do you mean exactly by making the keyboard processor handle autorepeat?
The way it normally works is to send a message to the main processor each time
a key is pressed, and again each time it is released. From what I remember
the codes are the same as the scan codes returned by Bconin and various other
functions, and the code has the top bit cleared to indicate the key as been
pressed, or set to indicate the key has been released.
As far as I know there is no way of configuring it to behave differently,
and there is no spare RAM on the chip to upload a routine of yours to do so.
What exactly are you trying to do that lead you to ask this question (I
guess you are trying to write a game that reads the keyboard processor
directly for keyboard control)? I might be able to suggest another way of
going about things.

169. What is user activity?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-12 15:20:20 UTC
From: mjl-b@minster.york.ac.uk
Message-ID: <726852019.7184@minster.york.ac.uk>
Source record: 41228

Having posted my screen blanker to c.b.a.st and the Atari archive, I got some new feedback about it and screen blankers in general.

As well as pointing out bugs, the problem of detecting user activity was raised. My screen blanker detects user activity in two ways.

It hooks in an IKBD interrupt handler and hence detects key depression (and release) and mouse movements. It also has a hook into the BIOS trap, so that any output via the BIOS bcon*() routines is regarded as "activity" -- something is happening.

The problem comes with those programs that install their own IKBD handler and that also do not do any BIOS output. There aren't many of these programs around, but it would be nice to have a consistent way of detecting user activity that worked with everything.

Jwahar Bammi suggested watching for VDI blits (i.e. calls to vro_copyfm). I don't like this because an additional GEM/AES handler will make the already slow VDI and AES even slower. I also have a gut feeling that there may be programs out there that blit stuff around even when nothing's happening. There's also the problem of those programs that use their own blit code for speed (such as Tempus and That's Write).

So, what do people think are good ways of detecting user activity? What about multiple applications under MultiTOS? Is watching for blit operations a good idea?

170. Request for RSC file format

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-12 16:11:42 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.726855102@oxygen.sys.uea.ac.uk>
Source record: 41225
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

```
This is my second request for this...

Has anyone got a description of the Atari RSC file (i.e. resource file)
format. I would prefer the new one but the old one (i.e. before the new
AES with colour icons etc) would be useful too.

Replies by EMAIL please...

Thanks,
Steve.

I just spent an unpleasant two days trying to fix my hard drive after it decided to go south. The story: playing with MiNT .95, running ICD 6.0.7 hard disk software. There's QuickST in the system, and that's it. I run Laser C (I use it as an editor), which hangs. No keyboard reset, the machine is gonzo down. I hit the reset switch, I get a BLACK SCREEN, then SuperBoot pops up, I continue, MiNT does not run and hangs the machine. And that's all she wrote, folks! My drive no longer boots. Can't recognize it when I run ICDBOOT from floppy. None of the utility programs I have even recognize that I had partitions on the thing.

Finally, I discover: the first 10 sectors of the drive are history. I get 6 bytes of 0a, then the rest is padded with 08. To abbreviate: only drive C was yonkered, I had to fill in partition information manually, and I had to recopy the 2nd fat on drive C to where the 1st should have been. CHKDSK tells me I have a few doubly-linked clusters now, and I recovered about 18 lost clusters, but I can live with that.

But I really really really don't want this to happen again. Does anyone have a CLUE why this might have happened? I'm not running MiNT until I can lay the blame at someone's feet. Thankx for your response.

cfaehl@polaris.unm.edu

>(1) It will work in accessories, if your library is sensible (most are).
> The OS Malloc() function cannot be called from accessories at all.

I have a question about this. From what I understand, malloc()
manages memory that is in turn allocated by Malloc() from the OS.
The advantage is that memory is allocated in larger chunks from
the OS. In other words, a malloc() call will give rise to a
Malloc() call if the malloc() function cannot find a sufficiently
large chunk of memory within the memory already owned by the
process. I conclude from this that it may not be entirely safe to
use malloc() in accessories. Rather, it must somehow be ensured
that the amount of malloc()'ed memory in an accessory never
exceeds the amount of memory which is initially reserved by the
accessory and managed by the accessorie's malloc() function. Is
this line of reasoning correct?

Two comments on this: Firstly, I have never understood why TOS
won't let accessories Malloc() their own memory, but considers
memory Malloc()'ed by accessories to belong to the main process
running at the time the Malloc() occurs. Does anyone know a
sensible reason why that is? Secondly, this silly problem may
become increasingly irrelevant when MultiTOS finally becomes
available...

173. Re: Porting UNIX Code to the ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-12 21:36:21 UTC
From: wallmann@backus.pu.informatik.th-darmstadt.de
Message-ID: <1ivdkIINN6q5@rs2.hrz.th-darmstadt.de>
Source record: 41229

```
[This maybe very much superflous, if the PURE-C lib has the binmode()
call, which I believe to know it hasn't]

As an alternative in PURE-C it is not very hard to patch the library, I
did it on the old TCSTDLIB this way:

Send a '\n' to stdout.

trace with the C-Debugger to the place, where approx. the following happends

library code:

cmp.b #$A,dx ;; somewhat like this (this has been a few years)
bne .....
move #$C,dy
bsr ....

remember the hexcode of and above these statements.

With a disceditor hunt for that hexcode, and change the bne
to bra. (better do this on a copy of the library)

This should work out for the PURE-C libs as well.

Nat!
P.S. If i remember correctly this might introduce some small problems,
when you use floating points, since there are apparently to printf
routines. The linker objects if the 'overloading' routine is
not from PCSTDLIB.LIB.

Disclaimer: This is from old memory.

This is generally true, but a clever library will detect whether the
program is running as an accessory or an application and adjust malloc()
to behave accordingly; for accessories, if the amount of memory requested
would exhaust the initial 'pool' of memory that the accessory allocated
when it was starting up, then the malloc() call will fail. For applications,
the library malloc can of course call the OS Malloc to obtain more
memory.

(So whether malloc() is safe to use in an accessory depends on which
library you're using. The GNU C and MiNT libraries certainly
give the correct behaviour for accessories; I can't vouch for
any others, but I'm sure some do.)

>Two comments on this: Firstly, I have never understood why TOS
>won't let accessories Malloc() their own memory, but considers

>become increasingly irrelevant when MultiTOS finally becomes
>available...

GEMDOS is a single tasking OS. That means that as far as GEMDOS is
concerned, only one application is active at a time. GEM does some
tricks to make it look to the user like accessories can also be
active; but GEMDOS doesn't know about these tricks, all it knows about
is its 1 main application. So every system call (including Malloc,
and also including Fopen and other file calls) made to GEMDOS occurs
in the context of the 1 GEMDOS program running, i.e. the "main"
application.

MultiTOS of course will change this. Actually, the whole concept of
an "accessory" becomes rather irrelevant with MultiTOS (since there's
no need for accessories, you can just write applications that stay
around as long as the user wants). Of course MultiTOS does load
accessories (for compatibility) and in fact every accessory becomes

a separate MiNT process (so they can Malloc if they want to; but
an accessory that takes advantage of this feature wouldn't work
under old TOS, and as I said there's really no reason to write
a MultiTOS-only accessory since they can't do anything normal
applications can't do. Applications can even make a menu_register
call to change the way their names appear in the "Desk" menu!)

Regards,
Eric

176. Help w/GCC

From: goluska@egr.msu.edu
Message-ID: <1j04bpINNqd7@msuinfo.cl.msu.edu>
Source record: 41231

I'm having trouble getting GCC running on my ST. I have gotten all
the files:
gcc231b1a.zoo
gcc231b1b.zooa.zoo
gcc231b1c.zoo
incl85.zoo
libolb85.zoo
gmlibo23.zoo
utlbin33.zooa.zoo
What I get when trying to compile a hello there program is an error in
stdio.h: NULL value on line 107 and an error in compile.h that says
improper #-line on the line after the last line of the file.
I realize that with C the errors may not be in those files, but I
don't know what's wrong. Any help would be greatly appreciated.

179. Extendo-Save

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-13 12:41:25 UTC
From: imr@cs.bham.ac.uk
Message-ID: <1993Jan13.124125@cs.bham.ac.uk>
Source record: 41234

Over Christmas I got hold of Warp9 and i really like the thing, especially the screen saver, Extendo-Save. The only problem is I want to write my own modules but can't really cope with 68000 well enough and am unable to compile the C examples with my ancient version of Lattice C v3 (the manual was no help either).

So if anyone knows how to compile the modules under Lattice v3 could they let me know. Either this or I shall finally get round to learning 68000 assembler.

Also are there any FTP sites with Extendo modules on ??

Cheers, Ian

I have, from a french magazine, explanations on the working of this chip,
up to, and including, it's assembler, with an example program. I can try
to dig it out. However, I do believe it *IS* the keyboard processor that
takes care of key repeat. (Since there is no interrupt at the time you hit
a key.)
Also, there is little room left in the processor's RAM (A few bytes only),
so you'll have to remove what is already there if you want to reprogram it.
The mag article gives a loader program that takes care of this.

Patrick.

181. Re: Home-made sampler help? (FAQ?)

The easiest sampler to make is one you attach to the printer port. ST Format did one like this very early on (issue 5 ish) and got Microdeal to rewrite Replay 3 to work with it. If you could get a back issue then I bet that would make your life a lot easier.

A friend of mine has the STOS Maestro Plus sampler, and once apart proved to be pretty simple inside. A D-A converter, a buffer, a smoothing capacitor. Getting input is pretty simple - if you reply to any read request you get the information appears on all cartridge port lines ($FF0000 is it?). The source code to sample comes free with the various Replay cartidges, but I don't know whether it is copyrighted.

OK?

David.

Nice idea, but having payed for an STE with Analogue joystick ports (I'm sure
they exist though I actually have no proof having never seen an analogue joystick
) I would really like to put them to some use. SO... has anyone built a sampler
around the ADC's in the analogue joystick ports... ?

Cheers, Ian.

183. TT and 24 bombs followup..

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-13 14:33:34 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1993Jan13.143334.27229@ucl.ac.uk>
Source record: 41238

It's obvious that no one knows enough about the TT's hardware to tell me if a dodgey SCC chip can cause the machine to crash if the {serial,modem}2 are accessed.

A reminder:-

Clean machine... TT030 4MB ST RAM, 4MB TT RAM.

Toggle CTS line on Serial2 port -> 24 bombs
Write data to either serial2 or modem2 -> 24 bombs
Both serial1 and modem1 ports are working normally.

Any ideas.. it used to work fine until Christmas when I was using serial2 as a login port with my 520STM as a terminal, all of a sudden I had a lock-up and the symptoms are those above.

Any ideas?

I have found that NULL error always occurs if in your gulam.g file
(I assume you are using Gulam) any of your TEMP variables have a \ after
a direct drive name:, as in:
setenv TMP G: will work
setenv TMP G:\ will not work

I found that out after various trials and errors and has solved the
problem of the NULL errors for every person who has had them.

] Any ideas?

24 bombs is "Spurious interrupt", meaning that instead of receiving DTACK on
the vector inquiry cycle, the 030 receives BERR.
You might look at the SCC programming, it might be wrong. I guess the SCC
provides no vector, and a system watchdog runs out and drives BERR, resulting
in the crash.

Cannot be sure however.

Vince.

24 bombs says that you got a spurious interrupt.
The manual I have here handy says:

Spurious interrupt.
If a device does not respond by asserting DTACK or AV during an intrrupt
acknowledge cycle, BERR should be asserted to terminate the vector
acquisition. The processor discriminates between this error and a bus
error by forming a short format exception stack and fetching the
spurious interrupt vector instead of the bus errro vector. The processor
then proceeds witht eh usual exception processing.

So IMHO your system doe sgenerate an interrupt on the interrupt line the
SCC is using, but the SCC does not respond with an interrupt vector
(followed by DTACK) or raise the AV (autovector) line.

The problem could be a broken scc, or some distortion on the interrupt
lines. Given the fact that it only happens when you access the scc, I
suspect the chip.

Good luck,

193. FTL MODULA-2, Gem and flying dialogue boxes

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-14 11:30:16 UTC
From: cmp0141@sys.uea.ac.uk
Message-ID: <cmp0141.727011016@radon.sys.uea.ac.uk>
Source record: 41097

I've been told that there is a collection of Gem libraries going under the name 'Gem Magic' written in FTL Modula-2. Apparantely they allow things like flying dialogue boxes and the such.

These sound like they'd make my presentation graphics system look 'rather good'. Does anybody know anything about them, like where they are< How can I get them? etc.

A couple of questions. How can you test for Gdos being present without 'vq_gdos'? Has anyone got 'vro_cpyfm' or 'vrt_cpyfm' working in FTL? I get the current graf_handle, pass this through v_opnvwk, set up the parameters, call the routine and Hissy Hissy Bomb Bomb.

Any help at all would be appreciated. Thanks, in advance.

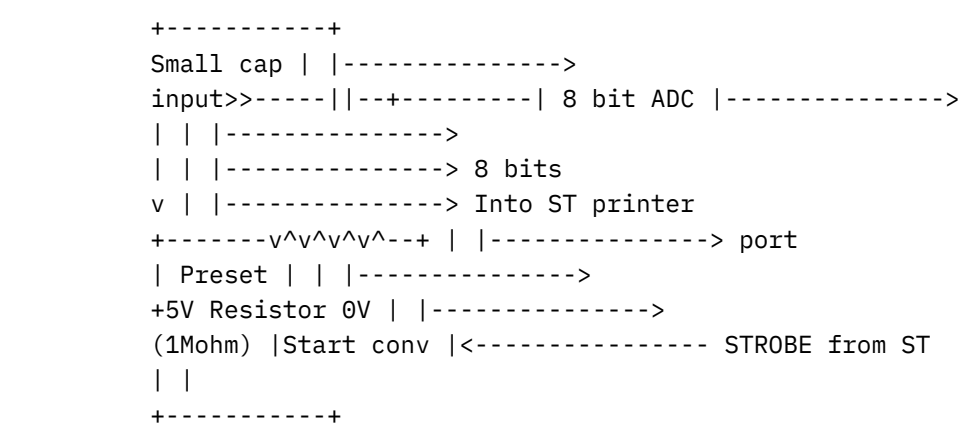
>some time.
>
> However if not does anyone have some documentation on the cartridge
>and DMA ports, ST Internals appears to be a bit lacking in detail. Thanks,

I built one that attached to the printer port. The basic circuit is shown
below: (this is from memory, folks)



The capacitor is there to remove any DC component from the input. The
variable resistor is then used to bias the input so that it always appears
above 0V (necessary for the ADC). The STROBE line is connected to the ADC's
"start conversion" input.

I think I used a 9V power supply (an old calculator "battery eliminator")
for the ADC, but you could use a battery or run a line from the ST's 12V
supply into a resistor bridge to drop the voltage to 9V.

Sampling is done by driving STROBE low, waiting the appropriate time (the
time it takes for the chip to do the conversion), putting STROBE high again,
and then reading the data from the centronics port. I wrote sample and
playback software myself, though I wish I'd known about ST Format and Replay3
-- it would have saved me some time!

The software provided an "oscilloscope" display -- this means you don't need
a real oscilloscope to calibrate the preset resistor to your audio input
source. Simply adjust the preset until the signal is not clipped at the high
or low levels. I found that the mono "headphone" output from a tape deck or
CD player worked well as a suitable input source.

I also added an 8-bit output, using a similar circuit and a DAC. (STROBE was also connected to the DAC's input latch). All the parts and the veroboard, box, connectors etc. I obtained from Maplin electronic supplies (I went to the Manchester shop, but they do mail order as well).

Hope this helps.

BTW, I tried your stblank program on a 1040STe (TOS 1.6) and it didn't work *at all*. I even tried putting it on a blank floppy by itself and booting with that and it didn't work either. The AUTO prog gives 2 bombs when it runs during the boot, then a couple seconds later, 4 or 5 bombs and total lockup. This was a real pain to get off my hard disk, which unfortunately I tried first. I had no problem decompressing etc., all files looked fine. Your readme file implied it had been tested on an STe, so I don't know what the problem is. AUTO folder stuff has to be tested very thoroughly!

199. how can you use a color monitor with a vcr?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-14 23:54:29 UTC
From: mage@sandman.caltech.edu
Message-ID: <MAGE.93Jan14235429@sandman.caltech.edu>
Source record: 41105

I have an Atari 1040Ste with (I believe, might have the number wrong)
a SC1224 Color Monitor. At any rate, it's the standard color monitor from
atari. My question is, is it possible to use this as a way to view a
vcr, using the video out and audio out jacks on the vcr?
I looked at the pinouts for the monitor port on the computer, but
it left me in the dark as to whether the monitor accepted composite video
or seperate RGB inputs. And of course the "manual" that comes with the monitor
has pages of lovely directions on such difficult topics as turning it on
and adjusting the volume, and nothing on hardware specifics.
Also, if it does use RGB inputs, is there some piece of equipment
I could buy or make that would seperate the composite video from the vcr
into RGB?
Please reply via email, as I only read this group every couple of
weeks. I'll post a summary of any replies I get.

thanks,
michael hoskins

This is, of course, utter nonsense. As you know, output from one program is
often input to another, and many ST programs don't get along with \n-
separated lines in input all THAT well. So if you try to run your oh so
favourite UNIX program and load the results in, say the Pure C editor,
you're in for a nasty surprise: it won't work. Another problem: your
favourite UNIX program may try to read some file that a "real" ST program
has written. Again, problems; it is very probably that it will choke on
the \r characters one way or another.

> Note that I didn't reccomend that people write code from scratch using

> bothered.

If you can't be bothered, you should not be porting code. Or using a computer,
really. Deciding which output or input files are text and which are binary
is one of the main tasks of porting UNIX programs to other platform.

Yes, I like the UNIX idea of "one size fits all" better, too.

202. Floptical Woes

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-15 10:21:29 UTC
From: ralph@laas.fr
Message-ID: <RALPH.93Jan15112129@cubitus.laas.fr>
Source record: 41107
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

My Floptical drive has problems which I believe might be of a hardware origin. Mine is a Freedom Floptical Drive, and it's back panel gets hot as someone else posted in either ZNet or AEO. It is connected through an ICD AdSCSI card to my Mega 4 ST running TOS 1.2. I use ICDBoot 6.01. The particularity of my installation is that the AdSCSI card gets its 5V from the Floptical drive. Rather than use the 1.4 amp 9V power supply that came with it, I use a 2 amp 9V power supply.

When the drive is empty, ICDBoot sees the drive and says it's an INSITE drive. When I place a diskette in the drive, the light comes on as it tries to find out (my conjecture) what kind of diskette it has. With any diskettes, 720k formatted ones or 21m unformatted ones, this sensing operation loops and the drive makes a light clunking sound at 2 second intervals. During this state it must be sending a busy signal back to the AdSCSI adaptor since neither ICDBoot nor IDCheck sees the drive.

Any suggestions? Or do I have to mail it back to the dealer? By the way I verified that the AdSCSI adaptor functions satisfactorily with a Mac hard drive.

Thanks,

I'm afriad not. This is OK on the ST but fails big time on the Falcon
(which of course is how I discovered it). I regret to say that you have to hit
the hardware and do it differently on the ST, STE and Falcon.

What you want is a routine to set the video address on the n'th frame, lets
call it vsynx(n) where n is the frame rate. You'll also need a vertical blank
routine too.
Vsynx will already know from some initialistion what kind of machine we are
running on so will take appropriate action.
If it's the nth frame, vsynx will change the address immediately on the ST but
store it for use by the vbl routine on the Falcon. The vbl routine can just
look at a variable and if it's none-zero stuff it in the hardware then clear
the variable.

Do NOT use the system variable screenpt (@ $45E) to set a screen address at
VBL. That variable is never cleared by TOS (even after a warm boot) and can
result in some really screwy memory usage.

Avoid bus errors on the ST by not sending data to non-existant STE locations.
This is with respect to the low part of the video address at $FFFF820D.
Always use the Cookie Jar to find out what kind of machine you are on and
remember that if there is no Cookie Jar ($5A0==0) then you're on an ST or
some total arse in running an old RAM loadable TOS on a new machine.

I don't think the IKBD processor handles keyboard repeat. There *is* an
interrupt when you hit a key -- it's the IKBD packet handler (oddly enough
:-))

If you want to see an example of catching the IKBD interrupt, please
download the source to my screen blanker, ST Blank, from atari.archive (it
was also posted to comp.sources.atari.st).

209. MiNT Distribution kit - update.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-15 15:41:20 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <1993Jan15.154120.13214@sol.ctr.columbia.edu>
Source record: 41114

--

The kit has now been updated (as of a few days ago) to include
gcc 2.3.1, the man4 suite, the patchlevel 25 libraries, a 'compress'
program etc.
All of this is available at a.a.u.e or mirrors.

The main reason for posting, though is to say that there are obvious
problems with the kit and certain TOS variants. I haven't heard from
anyone who has successfully installed on a TT or a mega-STe yet, (I
have heard from plenty of people who *haven't* managed to install on
those machines...). Also, there is apparently a problem with TOS 1.0
in that Pexec() and GFA don't mix very well. I am assured that this is
not specific to GFA, but is the fault of TOS.

For all the rest, I have heard from plenty of people who have now
installed on ST's, STe's etc. So, I judge that the kit is probably
robust enough now for those machines.

I am looking into the problems of newer TOS's not liking the programs
but I can't promise much, I'm afraid. I've written to GFA, and I'll
see what they say.

The main problem seems to be due to direct manipulation of the DTA.
MiNT don't like this, (according to the docs), but TOS should have
no problems. (I must say that I've not had any problems with MiNT
not liking the DTA on my ST or STe).

The reason for using the DTA is that GFA's EXIST() function ignores
directory entries. So the only way to find out if a directory exists
is to use FSFIRST/FSNEXT and the DTA, as far as I know.

Anyway, hopefully better news will be coming this way soon. Presumably
if GFA has no solution, I'll have to write in C. Ah well- shouldn't be
a problem, but I just wanted to use GFA-GUP - it makes life so much
easier...

Simon.

Two things:

- You have to change the setting on the drive from drive 1 to drive 0
- The cable goes upside down. Make sure you are connecting it the right way.

The head of the drive that was on the ST came flying out one day and I had to replace it with a Panasonic 1.44Mb. This was about 2 weeks ago.

|> p>And, if it may be a virtual handle, do I need to load the fonts
|> p>for every new virtual workstation or is one time enough?
|>
|> You have to load them for every workstation, since resolutions will differ on
|> different devices.

As I can see, I have to load all the fonts for every (even if it is a virtual)
workstation. Thus I've tried to use FontGDOS with it's font cache. In spite of
a large cache a multiple started MultiList (uses GDOS fonts) caused GDOS to
load the fonts from disk every time ! :-(
Is there somebody having the same problems with FontGDOS?

My second problem has nothing to do with fonts but with VDI raster operations.
Can I use vr_trnfm() (transform form) to calculate a device specific raster
from a standard raster WHERE psrcMFDB.fd_addr == pdesMFDB.fd_addr ? As I know,
rasters in vro_cpyfm() may overlap. Or do I have to create a new raster of the
the same size as the source raster, then to transform it and then to delete the
source (becomes a problem with large rasters) ?

Which structure members in pdesMFDB do I have to set? Does VDI do this work?

Thanks in advance,

213. 8 bombs?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-15 18:05:03 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1993Jan15.110519.4251@arizona.edu>
Source record: 41118

A friend of mine has been having problems with his old 520 ST. First, on occation, the computer (with external SS-drive) started saying that all floppies where blank (0 files, 0 bytes used) whether they were or not. Then, red patches started flickering on the screen. He took the computer apart to look for loose connections but found none. But since he put it back together, whenever he boots up (with or without disk) he always gets 8 bombs.

Any suggestions?

-Paul Harris @ @
paul@jupiter.ame.arizona.edu ___/

I have a Supra 10 meg floppy drive that probley works the same
as your Floptical drive or any removeable drive other than a
regulator floppy. You must have a disk in the drive when you
turn it on so the it can initialize then boot the computer.
Let me know if this helps.

>How are the TOS ROMs laid out on 2 chip versus 6 chip ROMs? Is it the the exact
>same data but with the first 3 chips on 1 ROM and the next three on the second
>or something more insidious?

This is some way of correct:
The 2 Chip ROM includes the normaly 6 ROMS, (actually I think the Capacity
of those 2 rom roms is 1 M. this is what the Mainboard says). The
selcting logic is external from the GLUE which generates the CS lines for
the normal (6) ROM Chips.

BUT there is no 1M eprom available which fits into the 1MB ROM socket.
At least not as far as I knowthose chips.

[deleted]
>
>Yes, I like the UNIX idea of "one size fits all" better, too.

Actually under both UNIX and TOS (or MSDOS) file system there is no
"text mode" and "binary mode" (unlike "typed" file systems like the
VAX VMS and UCSD p-System, which have several completely differently
formatted file types managed by the OS).

The problem isn't that UNIX is untyped and TOS is typed, the problem
is that the two systems decided to use different "end of line" delimiters
to seperate text lines in their single untyped "byte stream" file format
when writing "text" to the file.

Working under a true "typed" file system like VAX VMS or UCSD p-System
is considerably different than working under "untyped" file systems
like UNIX and TOS use... you have to be SURE to call the right library
routines appropriate for the file type and open the files in the right
mode, or they might never even work in the first place.

But how the "line delimiter" is converted when porting UNIX code to TOS
(or TOS code to UNIX, if someone was that "crazy" :-) is just one minor
problem that can be handled in a variety of different ways (and is nromally
not a problem for languages like Pascal and Modula-2, which already
recognize that different OSs might treat different files types differently
and provide WriteLn which writes whatever is appropriate for the OS and
file type. Note some OSs like VMS have SEVERAL different types of "text"
files using totally different line delimiting).

U> Do you require Pure C/Turbo C to write a CPX? I was under that
U> impression (the _only_ CPX sample code I've ever seen was Turbo C
U> code)...

No, Lattice 5.5 gives you, as one of the 'make program as' options, under
the linker options from memory, CPX. There's also a 'linkcpx' or similar
program for people not using the IDE.

U> If it's true, Atari is just plain _stupid_, since they use Lattice
U> inhouse, and tonnes of ST developers would rather use GNU C or Lattice
U> C.

Atari's stupidity is evident in their management and marketing activities,
but on the whole their technical work has always been excellent, if limited
for budgetary reasons...

>The manual I have here handy says:
[description deleted]

This is interesting -- I've seen it elsewhere. A colleague of a friend working on a TT product had serious problems with spurious interrupts from the serial communications controller. He called Atari and told them there was something wrong with the TT design (this was in the early days of the TT -- they had quite a few, and the problem occured on all of them). Atari said "there are never spurious interrupts under TOS" and refused to believe that there was anything wrong.

I think they eventually worked around the problem by putting lots of NOPs after any instruction that wrote to the SCC -- you might give this a try.

A note to all those struggling to get SETUP.PRG and INSTALL.PRG to work in the MDK. Apparently (blush) the programs do *not* work unless you're running in mono mode. I did try to make them resolution-independent, but apparently not hard enough.

If you haven't got a mono monitor, then in the short term I suggest using a mono emulator (sebra or equivalent). This bug will be fixed (hopefully) this weekend, assuming I get the time.

Simon.

225. Parent-child processes where parent links to a vector

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-17 03:22:12 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <80438@hydra.gatech.EDU>
Source record: 41130

I've got a program that runs from the hard disk but requires the insertion of the original floppy to run. I hate to have to use a master copy of a floppy, so I'm trying to defeat the protection. I've tried copying the disk with ProCopy but it couldn't duplicate it. So I loaded the program into a monitor and stepped through it. The program reads data from side 0, track 0, sector 0 using the XBIOS and modifies itself with that data. The idea I had was to make a parent program that would link to TRAP #14 and contain the data of that magic sector. It would execute the protected program as a child process. Instead of executing the XBIOS floppy sector read routine, it would copy the sector data. After the child process terminated, the parent would delink itself using XBRA.

I wrote the parent program and tested it first without executing the child program. It cleanly linked into and out of the TRAP #14 vector and terminated with no errors. I did make sure to free all memory above the BSS. I also made some XBIOS calls in the parent program to test it out. I then added the code to load and go the child program. It did execute the child but my computer locked up after the child terminated. I also tried executing another program I wrote (one that I knew did nothing illegal and no vector linking) as the child and it locked up my computer upon termination also.

Is there anything illegal about what I'm attempting? Has anyone tried something like this and been successful? FYI, I have a Mega STE.

From: yonder@netcom.com
Message-ID: <1993Jan17.053709.8026@netcom.com>
Source record: 41131
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Howdy folks... Any overscan users out here? I just have a coupla questions.

Is it worth the trouble? Basically the answer to this is a function of the number of programs that will take advantage of it.

Would stalker, rufus, and/or connect take advantage of it? How about uniterm?

How about Spectre... would I get the extra Rez in Mac mode?

Basically I would like to be able to get more data on my screen at once.

There is lots of dead space on my SM124, so it would seem that this modification, would give me many more lines/columns of text.... is this true....

Note: I am a monochrome monitor user (SM124)....

Also I have an old 1040STf... I do not have the new TOS 1.4, will this be a problem..?

thanks..... .....Chris

Message-ID: <1993Jan17.133735.27588@sol.ctr.columbia.edu>
Source record: 41132

Well, I've found the major bug in the SETUP and INSTALL programs that
prevented them from working in resolution other than ST-high.

The problem lay in that GFA-GUP provides 'read-only' procedures that
the user is not supposed to touch; one of these procedures (init_gem)
has lines a little like...

```
if (xbios(2) <>2)
form_alert(ro_needhi, ...)
endif
```

... which is a little silly in my view. It's
the first time I've used this package, so I've not encountered it
before.

Anyway, I've fixed that, and checked that it works for me in ST-medium
resolution, so things ought to be a little better now. Note that it
is not designed to work in low res - the dialogs don't have enough
screen space.

I did bring it in today, but you're going to have to wait till
tomorrow because the STe's IBM-like disk format isn't good enough for
mtools on our SparcStation :-(

I'll be incorporating the new additions to init and make asap.

Simon.

Now here's a toughy. I grabbed a load of Signum II fonts for use on the Uni's
Mega ST and found that they were configured for the German keyboard (Q and
W swapped and a few other charachters were juxtaposed too). Although the fonts
were very nice only laser printer fonts were included. On the
Signum source disks no laser font editor is supplied so I could not manually
swap them around to fit the British keyboard configuration. Any ideas
where I can get some software which would enable me to do this?

>Can someone tell me which of this 2 and the GCC is a better
>C package to work with?

I can't speak for Prospero C or Mark William C (do they still exist?),
but GCC is an EXCELLENT compiler. The pros/cons are:

1. GCC produces FAST code.
2. GCC is slower at generating code.
3. GCC is Free (ie. you get updates :-]).
4. GCC is more correct (ie. follows ANSI standard more closely).
5. GCC code is more portable.
6. GCC uses LOTS of memory. 2M minimumj for GCC, 4M for G++.

>I am looking for an assembler also. Is there any public domain

GAS, the GNU assembler, is part of the GCC suite. You can also do
inline assembler with GCC (actually, this is the preferred technique
for me).

>Also, can someone please give me examplese of the case where
>using assemmble language is better or necessary than using C
>or other high level language?

Assembler is very rarely necessary. Only cases are for writing
interrupt routines, since you can't say "RTE" in C :-).

Assembler is useful when used sparingly, and then only when you've
already written the code in C. I write everything in C, then for
the parts that I find are too slow (find out by using gprof, the GNU
profiling tool), I convert to inline assembler, with the C code
conditionally excluded. ie.:

```
void add(int a, int b, int* c)
/* Not that anyone would really do this :-) */
{
#ifdef NOASM
*c=a+b;
#else
asm("
movel %0,%2@
addl %1,%2@
" : // No outputs
: "d" (a),
```

```
"d" (b),
"a" (c)
);
#endif
}

>(which of course is how I discovered it). I regret to say that you have to hit
>the hardware and do it differently on the ST, STE and Falcon.

More info, please! Ignoring the fact that the program will run faster,
is this wrong:

```
Setscreen(-1,location,-1);
Vsync();
```

?

Okay, more care is needed if the frame rate is slower than 60Hz on an ST,
but that's a separate issue.

Thank you for ~140 KByte of data that I didn't want and that cost
real money: storage, phone transmission (what about people with
2400 Baud modem) and so on.

DON'T DO THINKS LIKE THAT (I'm shouting because this was the second
time this week).

237. Re: Resource file format

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-18 10:56:46 UTC
From: cjr@cs.bham.ac.uk
Message-ID: <C11qEn.KpI@cs.bham.ac.uk>
Source record: 41146

```
Someone recently requested the RSC file format. This is the TOS 1.4
version (I hear there is a new one):
typedef struct
{
short rsh_vrsn; /* RCS version no. */
unsigned short rsh_object; /* offset to object[] */
unsigned short rsh_tedinfo; /* offset to tedinfo[] */
unsigned short rsh_iconblk; /* offset to iconblk[] */
unsigned short rsh_bitblk; /* offset to bitblk[] */
unsigned short rsh_frstr; /* offset to free
string index */
unsigned short rsh_string; /* offset to first string */
unsigned short rsh_imdata; /* offset to image data */
unsigned short rsh_frimg; /* offset to free
image index */
unsigned short rsh_trindex; /* offset to object tree index
*/
short rsh_nobs; /* number of objects */
short rsh_ntree; /* number of trees */
short rsh_nted; /* number of tedinfos */
short rsh_nib; /* number of icon blocks */
short rsh_nbb; /* number of blt blocks */
short rsh_nstring; /* number of free strings */
short rsh_nimages; /* number of free images */
unsigned short rsh_rssize; /* total bytes in resource */
} RSHDR;

You should be able to figure things out from here (and using a hex
dump of a RSC file). All values are Motorola format (big-endian).

238. Sozobon C Problem - Flopfmt

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-18 11:43:11 UTC
From: mm68@unix.brighton.ac.uk
Message-ID: <1993Jan18.114311.27851@unix.brighton.ac.uk>
Source record: 41151

I am investigating the xbios calls flopfmt, flopwr, protbt to format a disk. I am using the Heat n Serve Sozobon C compiler v1.33 I think it is.

I have #included the osbind.h and stdio.h headers as I guessed you would need and am using the macros Flopfmt, Flopwr, and Protbt to do this, firstly formatting the disk sides 0 and 1, tracks 0 to 79. Then I write 0's to tracks 0 and 1, prototype a non-exe boot block and then writing it.

The thing is, the compiler keeps giving me the same error:

undefined symbol _lonh in module d:\tmp\f where d:\tmp is my ramdisk temporary directory. Can anyone help.

Thanks

I've asked nearly the same question two weeks ago and from the answers I've
got I can tell that it should be possible. The SCSI-2 port is able to support
older SCSI-1 (so to say) units.

Thanks for your and other people's help. I've been told that there is a a chip compatable (both SW and pin) with the SCC (53C80) but which has larger I/O buffers, so decreasing the interrupt loading on the main processor when running at high speeds, is this the case?

If so I might get one of those as a replacement.

Ok, the updated versions of SETUP and INSTALL (hopefully now
resolution independent) have been uploaded to the New directory at
a.a.u.e. They are also available immediately at phlim.ph.kcl.ac.uk
via anonymous ftp.

The file 0readme in the Updates directory has more details.

changes have been made to disk1.zoo Man4.zoo 0readme, and init1.zoo
(a new file).

Simon.

As I said, it was working, then it suddenly stopped working. As the desktop
also causes the same problem when you try to write to either of the SCC
ports it's obviously not something which could be fixed int software easily.

246. ICDFORMAT question +

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-18 14:23:56 UTC
From: mbernar@erenj.com
Message-ID: <mbernar-180193092206@mbernarmac1.erenj.com>
Source record: 41155

I have a Tandon drive which I'm trying to format using ICDFMT. It has a sticker
on the mechanism that says TM262 and a label on the controller (I'm sure it's
MFM) that says TM362.

1) I would appreciate if someone could tell me the format paramaters since it's not included in my ICDFMT.DAT file. I've tried to guess
by just doubling the number of cylinders for the TM252, (306 to 612) but I keep getting a sense error.

2) An explanation of the jumper settings (w1,w2,w3,w4,w5) would be appreciated. I think w1 and w2 select units 0 and 1. Do I assume that w3, w4, and w5 just
sets it to units 2, 3, and 4? Do these jumpers mean the same thing for ST506/412 compatible drives?

3) Someone, please tell me the most recent version of AdSCSI software before I
try calling their BBS at 815-968-2229. I read here before that they are not
available via ftp.

But Cleanup isn't a defragger. It's great at what it does, but
defragging isn't it. Reports are that Diamond Edge is quite good. In
pd/shareware (not sure which) Blitz is the only one I haven't heard
horror stories about.

It is worth the trouble. There are some dirty programs that won't work in
Overscan mode, but you'be got to swich back (manually and automatically)

>Would stalker, rufus, and/or connect take advantage of it? How about
>uniterm?
Stalker: Never used it. Rufus & Connect: Yes. Uniterm: NO

>How about Spectre... would I get the extra Rez in Mac mode?
Propably no. I never used Spectre...

>There is lots of dead space on my SM124, so it would seem that this
>modification, would give me many more lines/columns of text.... is
>this true....
Even with Overscan you'll still have some border left. I got 6 more
columns and 3 or 4 more lines. That's great for text processor etc
(full 80 columns even with a window!)....

>Note: I am a monochrome monitor user (SM124)....
Same here...

>Also I have an old 1040STf... I do not have the new TOS 1.4, will this
>be a problem..?
Well, TOS 1.4 (or, to be correct 1.04) is old. 2.06 is the current version
for all ST(E) models. Overscan will work with 1.02 but I would recommend a
newer TOS version for better HD performance and less crashes...

It sounds as if the information file was missing from the root directory --
someone else reported this causing bombs. I had thought I'd handled that
situation, but obviously not. Such bad behaviour is embarrassing.

Make sure you have STBLPRG.PRG in \AUTO and STBLANK.INF in the root directory.
If this still doesn't work, please mail me with a full description of the
contents of your AUTO folder.

ST Blank _has_ been tested on an STE (and a TT, for that matter).

Please not that ICD Cleanup is not a defragger but a filesystem analyzer/
repair program. It cannot defragment files. (At least my version cannot.
Can your's?)

Ha ha. But YOU are the one whose job doesn't get done because different programs battle over different end-of-line-delimiters. So maybe this IS your problem, after all. Okay, you can get your UNIX software to compile, and even sort of run, but it cannot be considered "working" as long as it doesn't coexist with already working ST software in a meaningful way.

Hi,
as far as I know there are no _good_ defraggers for the Ataris.
I would recommend DISKUS by CCD or 'The Optimizer' by 'Projekt FPS'
they are fast and reliable.

Bye Wolfgang

[stuff deleted]

Oh sure. You're right of course. There ARE those nasty "typed" file systems that are EVEN WORSE than what we are squabbling about here. I remember hacking away at a VMS system trying to find the mode to open a file that yields exactly as many bytes as the stat(2) emulation says the file has. I didn't found one, and I guess it simply can't be done. So maybe we should consider ourselves lucky, after all :-)

So let's rephrase. The problem is indeed not that UNIX doesn't have a typed file system while TOS has; this is rubbish. The problem is really with the C language, whose idea of a text file differs from TOS' idea of a text file. So in fact, the problem is neither TOS' nor UNIX' problem, but C's problem.

In C source code, you'll find lots of I/O function calls that explicitly or implicitly write or expect a single '\n' as a line delimiter. This is not really part of the language proper (which is totally oblivious to I/O anyway) but of run-time libraries and/or common usage. This usage coincides (not incidentially) with the way text files are usually handled on UNIX systems.

Companies selling C compilers and libraries for non-UNIX platforms have struggled to make that C usage and the usual text file delimiter used on the target platform compatible. This is where "file types" come into the picture. Under UNIX, there is no need to distinguish text form binary files because no translation is necessary in either case. Under TOS (or MSDOS, Mac OS, or VMS, for that matter) things are not so simple: You have to tell your I/O lib calls which files are text files (and as thus should be translated from '\n' inside to program to whatever is used outside) and which aren't (and should definitely NOT be subjected to any such treatment). Failure to do so usually results in fouled binary files (because translation is the default), or fouled text files (if you disable all translation).

Okay. So if you write/compile/whatever C programs that produce "text" files with '\n' delimited lines, TOS couldn't care less. Those files are perfectly legal TOS files. But they violate common TOS usage and are thus no legal text files in a TOS environment. So your program has to be considered malfunctioning, just like a program that writes files containing ISO-8859/1 coded 8bit letters.

> The world of computing isn't just UNIX, no matter how much
> some people might want to believe it is :-)

True, but the rest of it (or most of the rest) is violently struggling to
behave like UNIX, and failing :-)

It's true.. My father was able to install Mint on his machine from
the distribution kit when he was running under mymono. So all is
not lost for the people using color monitors. Have fun installing.
It is definately worth it. Well, I should grab some sleep now.

In article <C0w4vs.Frt@cs.bham.ac.uk> cjr@cs.bham.ac.uk (Chris Ridd) writes:
>Folks, what is the memory.sys driver that came with FontGDOS 2.0?
>How do I use it from C?
>
>Apologies if this has been mentioned before!
>

Well it has been mentioned but I'm not sure if any firm conclusion
was drawn about the use of MEMORY.SYS. My theory is that MEMORY.SYS
could be used to VDI stuff to memory rather than say a screen
(log or phys) or hardware device.

It would be very useful if one could, say VDI a drawing to a memory
buffer and then blit it out to the screen via vro_cpyfm, this would
save having to mess about with the logical and physical screens (which
take up a lot of space). Unfortunately I havn't figured out how one is
is supposed to get the VDI output back from MEMORY.SYS?

>My general impressions of FontGDOS are good, it's replaced G+PLUS on
>my hard disk.

Agreed, I've noticed no slow down with having FontGDOS installed,
in fact I now have it installed all the time - lets hope SpeedoGDOS
(spelling?) will be the same.

>Why do the CPXs have such an awkward interface though?
>Setting the font caches (even using the docs) is really obscure.
>
Agreed again, those CPXs are quite difficult and non-intuitive to use.

Ah, but mere mortals cannot obtain it!

A further question, if I may...

What defraggers will work on MultiTOS filesystems (how different are
they from TOS filesystems?)

At the moment, it is a toss-up between Cleanup (cheaper!) and Diamond
Edge.

Thanks!

well, both 'The Optimizer' and Diskus can check and clean up a Disk.
I don't know if there is a english version of Diskus, but there is a english
version of 'The Optimizer' available.
Both programs can run under any resolution (not ST low rez).
For Diskus write emial to: seimet@rhrk.uni-kl.de
for 'The Optimizer' contact Peter Speemann, Weilimdorferstr. 73,
DW 7000 Stuttgart, Germany.

>activity that worked with everything.

I have been looking into the way the IKBD communicates with the main processor
recently, and as you probably know it communicates via a serial line going to
one of two identical serial chips, the other of which handles the MIDI port
(The RS232 port is handled by the MFP). Both of these serial chips generate
an interrupt when a byte is received, in fact the interrupt request lines are
ORed together and go to the MFP at the same interrupt level, generating an
interrupt through the same vector.
In the code pointed to by this vector, all versions of the operating system
that I have seen (well, both versions!) JSR (ikbdsys) then JSR (midisys)
repeatedly until no bytes are incoming from either source.
This means that (assuming you use the ikbdsys vector to detect mouse
movement and keyboard presses in your screen saver):
(1) In your ikbdsys routine you must check whether there really is a byte
from the IKBD, otherwise the screen saver will not work with MIDI activity is
taking place.
(2) You can patch TOS at the MFP interrupt vector level to avoid problems
with people stealing the ikbdsys vector.

I will post a disassembly of what TOS does at the moment (pointing out the
bugs!) and further details (ie. The address of the MFP auto-vector involved)
when I get around to it.

Does anyone knows where I can find the library NKCC (from Harald Siegmund)
on FTP.
It an Assembler and C library for a better use of the keyboard in programs.

267. Gem programming

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-19 12:19:33 UTC
From: baumer@cs.utwente.nl
Message-ID: <1993Jan19.121933.23575@cs.utwente.nl>
Source record: 41175

I am in the process of writing a TIFF-viewer for the Atari. However I have some problems I do not seem to be able to solve. Always if I start the program an irritating cursor is flickering in the corner. How is it possible to remove it? And why is it there?

I also have a problem with the dialogues. When I remove the dialogue, it leaves a rectangle on the screen in a different color than it should be. This is the procedure I use to handle a dialogue:

```
> int hndl_dial(tree, def, x, y, w, h)
> OBJECT tree[];
> int def;
> int x,y,w,h;
> {
> int xdial, ydial,wdial,hdial;
> int exit_obj;
>
>
> form_dial(FMD_START,x,y,w,h,xdial,ydial,wdial,hdial);
> form_dial(FMD_GROW,x,y,w,h,xdial,ydial,wdial,hdial);
> objc_draw(tree,ROOT,MAX_DEPTH,xdial,ydial,wdial,hdial);
> exit_obj = form_do(tree,def) & 0x7FFF;
> form_dial(FMD_SHRINK,x,y,w,h,xdial,ydial,wdial,hdial);
> form_dial(FMD_FINISH,x,y,w,h,xdial,ydial,wdial,hdial);
> undo_state(tree,exit_obj,SELECTED);
> return(exit_obj);
> }

> #define undo_state(tree,index,flag) (tree)[(index)].ob_state &= ~(flag)
```

The same happens with some accessories (for example the CPX-accesory).

Another problem I have is that I want my program to be completely GEM. However, the code I received from someone to put an image on the screen, is not GEM. Can I solve this by using vro_cpfm and vro_trnfm? And is there enyone out there who knows what the function vro_trnfm is supposed to do? I cannot find a satisfactory description in "Das Profibuch".

Greetings,

Han Baumer.

```

>Can anyone point me to any documentation for doing this sort of thing - how
>to access function parameters, and pass back return values etc.

You need two sets of documents, both of which are found in the GCC source code distributions. The first is simply the GCC manual, which is written in the FSF's Texinfo formatting system. You can process this with TeX to produce a nicely formatted hardcopy, or run makeinfo on it to produce an online readable document. (Use emacs or the standalone info browser to read it.)

The next thing you'll need is the Motorola 68000 machine description in the GCC sources. Specifically, you need to read m68k.h, which documents the constraint letter codes used to describe the characteristics of the operands you'll be using.

Looking at the example above, you can see the basic structure of a GCC asm statement.
asm("opcodes" : outputs : inputs : clobbers);

The opcodes are specified using the MIT assembler syntax, and may be separated by newlines or semicolons. You can specify a particular operand using the "%X" notation, where X is a digit from 0-9 (don't remember, I think 9 is actually too high). The outputs, inputs, and clobbers are all optional, but must be specified in order. If, as in the example above, you only want to specify inputs, you need a colon as a placeholder for the (empty) output list.

(Oh yeah, stepping back a sec - inputs and outputs are C variables, specified by name. Whether they are local or global doesn't really matter, the compiler will handle them appropriately, based on the constraint codes you specify. An input variable is one that provides a value to the assembly code, an output variable is one that gets written to by the assembly code. The "clobbers" is a list of register names that will get overwritten by the assembly code. The compiler will emit code to save and restore these registers if necessary, before and after the assembly segment you write.)

The variables are specified with a constraint in quotes, and the variable name in parentheses. The constraints used above ("d" and "a") specify data and address registers, respectively. For a data register constraint, the compiler will load the specified variable into a data register prior to emitting the given assembly code (or leave it if it's already in a data reg). Likewise for the "a" constraint. The %0 in the code specifies the first operand, which is the variable 'a' in the above example. You should read the m68k.h file and the GCC manual to see what other constraints are available.

I know for sure that there is a commercial After Dark version on the Atari.
You can write your own modules if you can program in C.
A company in Germany sells it for 99.- ! :-(DM (Deutsch Mark).
The german magazin ST-Computer tested it in their 1/93 issue if I remember
correctly.

Chkdsk move files cluster by cluster and is very slow, but I haven't had any other problems with it. Anyway it moves the head back and fort so much that I am afraid it is going to wear out my disk. My opinion is that defraggers should not be used to often.

You should be able to use Jeremy Hughes' FONTKIT PLUS 4 to edit and reconfigure Signum fonts. It's available from the ST Club, 2 Broadway, Nottingham, NG1 1PS, UK.

>
> I too was thinking about such a program, and I was also thinking about
>writing a small one. BUT: When I say small one, I really mean small. ...

ok, before people start re-inventing the wheel... these are `on their way':

1. hacked version of smail 2.5 (mail transfer, handles local and uucp mail. btw don't confuse with smail 3.x, 2.5 is more `small is beautiful'. :-) origins from the days before MiNT so it still needs a few fixes when it comes to locking etc. (soon)
2. elm 2.3.something (mail reader). nice but a little big (ps says ~450K), so if you still want to write a simpler one like `mail'... but note it would only need the mail reader part because smail is already there.
3. taylor-uucp 1.03 (does the actual file transfer and spool managing etc between systems; not needed of course for just local mail.) this seems to run quite well already, although i had to hack my own maybe-not-100%-kosher read() and write() replacements to get decent performance on fast connections. (i'm talking big packets and 1800s cps here... :-)

now what we still need:

1. a decent news system and news reader for MiNT... the nn port to TOS mostly works so thats maybe not too important (source is lost :-( ) news system i currently use a still-beta binary version of mnews for TOS and it looks like that will be the last one.
2. someone to write all the docs so that also non-unix types can get all the things installed. (especially if it really should go onto distribution disks :-)

now if you want to help or just look at the stuff: current versions of smail and taylor-uucp are on wowbagger.pc-labor.uni-bremen.de [134.102.228.9]...

```
ftp> ls "-l incoming/atari/mint"
...
-rw-rwx--- 1 ftp src 116143 Oct 23 13:42 sbin0610.zoo
(smail binaries)
-rw-rwx--- 1 ftp src 87923 Oct 23 13:42 smai0610.zoo
(sources and docs, sorry atari-specific docs in german...)
...
-rw-r----- 1 ftp others 588029 Jan 08 10:03 tuu103_3.zoo
(diffs etc + binaries; you also need the original (un*x) distribution)
-rw-r----- 1 ftp others 52554 Jan 08 10:03 tuu103d3.zoo
(ditto without binaries)
```

the original taylor distribution should be on any good GNU archive,
the TOS-nn is on atari.archive(?), the other things (elm, mnews...)
are not yet publicly available (i think).

274. Re: GENERIC Synth Patch Editor Code (1/2)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-19 16:31:23 UTC
From: wrighttj@uhura.aston.ac.uk
Message-ID: <1993Jan19.163123.22084@aston.ac.uk>
Source record: 41184

Okay, I pulled this down and had a play with it (I've got a
Yamaha TX 81z) and here are my first thoughts.
1 - It's very pretty, nicely programmed... reminds me in a way
of the Midi Manager page from Cubase but with a few more
dedicated features like envelope displays.
2 - The price is listed in the docs as 29 uk pounds, or quite
a bit more in the states... I think 50 dollars plus about
20 dollars airmail as it's a UK company. This means this
is more a demo than PD (Quite a lot is disabled) but the
actual software is pretty cheap (other generic editors go
for 1-200 uk pounds, from what I've seen... anyone know
better?)
3 - It _doesn't_ say whwther you could program your own editor
modules if you bought the software, or if you'd need to buy
them as well... Does the original poster know?
4 - The load up time stinks. I'm running TOS 1.4 off a Sysquest
Hard drive and this thing took _one_and_a_quarter_minutes_
to load (I timed it...) which is way slower than anything
else I've seen. If the DA version (included in the full
package) takes this long to load, I'd never use it... this
(to my mind) is the biggest problem.

Anyone else got any thoughts?

|> Han Baumer.
|>

The TOS cursor should only appear if you have the file as a .TOS filename, or in DevPac if running without GEM (menu item).
To get rid of the cursor, look at XBIOS cursconf().

When a dialog is removed, GEM redraws the desktop in what it considers to be the correct colours. I think that unless you redefine the backdrop (don't ask me how) then you'll just have to comply with GEM's preferences. Anyone?

Hope that makes sense...

David.

Really!! Then why is it that when I bought my Signum2 with Laser Fonts
I DID get a Laser Font Editor supplied with them. Go back to your vendor and
demand this editor - it is called DCS30L.PRG and has an accompanying resource
file.

By the way, any good ANONYMOUS FTP sites (presumably in Germany) where
I can supplement my current set of Fonts? The ones supplied with early Signum2
were not particularly good - and I don't appear to have much skill at Font
Designing - which is a tedious task anyway. I would really like to get
MAC-like quality from Signum using my SLM-605 Laser.

And finally, what of Signum3 ? We were promised it would be on the
market long ago (I even have a (German) demo disk) - but, of late, I've
heard NOTHING. Are they holding it back for the Falcon?

And really finally! I have a friend who wishes to purchase Signum2.
The UK dealers Signa Ltd. have long ceased to trade and, to my knowledge,
Signum2 is now unobtainable here in the UK. Does this mean that no-one cares
any more and that it would be legal to give copies of Signum2 to others?

In my humble opinion someone SHOULD care - it is by far the best
word processor for Mathematics that I've experienced on ANY machine.

Sincerely, W. Alan B. Evans

Hi! Has anyone got a notion of an 040-board for the TT?
At least I know of an board for the ST: the german magazine 'ST-Magazin'
currently publishes articles about a 040 self-made-board for the ST, which
they want to sell in the near future.
But, I've heard of none for the TT yet, just some 50-Mhz 030 boards for immense
prizes. If anyone has ever heard about such a board, please tell me!

Regards, Joe

I am currently using my old Quantum 80 and Syquest drives on the Falcon with no trouble. Unfortunately, the Falcon refuses to see the drives if my Mega with ICD host adapter is also attached, so I can no longer share the drives between multiple systems. (Major bummer! Haven't had time to try and figure it out. Probably the fault of AHDI...)

For that sort of price you could get the Warp 9 screen accelarator which has much more besides an After Dark-a-like screen saver. I've mangaed to write a few things for it and overall they are relatively easy (courtesy of good examples...). I use this all the time and it has improved the quality of life under TOS 2.06 no end!

282. Using Atari ST SC1224 on Mac Powerbook 160

Careful! Atari refer to those versions as 1.4, and 1.2 not 1.04 and 1.02!

(As long as you are understood it's not a problem however 8-)

Don't use a TOS version lower than 1.4/1.04 with a Hard-Drive, or it
will be *slow*!

(Without any patches, it takes all day 8-(

From: adp@csg.cs.reading.ac.uk
Message-ID: <adp.727475456@reading>
Source record: 41190

Hello world,
I've just got the sources for GCC 2.3.1 off atari.archive and tried compiling a cross compiler on our Sparc1 at work (SunOS 4.1.1). It gets most of the way through, i.e. makes gcc, cc1, cpp, and a number of other executable files, but make crashes out with the error

make: Fatal error: Don't know how to make target `objc-parse.y'

Any ideas.....?

Also got the gnuutils off (ld, nm, etc) and I seem to be missing a file "st-out.h". What am I doing stupidly!

Any help will be appreciated, i.e. probably telling me exactly what files I should need :-)

Thanks in advance,
Andrew Pollard

Could be just cause you named it .TOS, and thus window 0 (The green
background) is no longer there to redraw the screen. Otherwise, the first
and last form_dial being present, it should work.

>
>Another problem I have is that I want my program to be completely GEM.

>Profibuch".
>

vro_trnfm() changes the image between two modes. One places the planes
one after the other, and the other mode interleaves them (This is the normal
ST mode of doing things.

As for the code, either it uses Line-A, and then you can call VDI functions
to do the same thing (No need to change image format, they both use the same)
or it writes directly on screen (Bad practice, and very hard to figure out
what it's doing if he tried to optimize it)

> ...does anyone know if it is possible to make a sampler for an STE that
> connects to the analogue joystick ports and uses the internal ADC ?

When I got my STE, I wanted to do what you are sugesting, but after having
experimented a bit, I found that what was meassured vas not voltage (V) but
ressistance (Ohm's) to 0V.

(0 - 2 Mohm gave values from 0 - 255 in the registers)

So I belive there's no internal ADC, but just a counter meassuring the time
it takes a capasitor (F) to unload througth the resistor connected to the port.

This, in my opinion, makes is impossible to make sutch a sampler.

> Does anyone have any specs for these ports ?

I have the pinouts and the register addresses,if you are still interested.

Sorry for beeing so negative.

You will most likely need a recent host adapter (say, produced within the last 2-3 years) as older ICD and Supras probably won't cope with the drive's transfer rate. You will also need recent software that allows you to create BGM (Big GEM) disk partitions, to give you the most convenient access to all that space. I don't think you can cope with this drive if you only have TOS 1.0, but 1.2 and up should be OK.

>heard NOTHING. Are they holding it back for the Falcon?

No, Signum!3 is available, at least here in Germany, since April
last year or so. A friend of mine wrote his diploma thesis with
it, and he is very satisfied. It seems that Signum has been
completely re-designed, my friend actually said it was a whole
new system that has inherited some features from Signum!2,
including the capability of loading Signum!2 files. The major
drawback about Signum!3 is that it cannot be used without a hard
disk, and it requires at least 2 MB of memory.
If Signum is not available in the UK, I think one could still
order it from German dealers. I don't know if they sell English
versions and docs, though.

292. Atari ST RS-232 port

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-20 02:23:34 UTC
From: frost@janus.enet.dec.com
Message-ID: <1993Jan20.022942.11382@engage.pko.dec.com>
Source record: 41050

Hello,

I have a question regarding the STs RS-232 port. I have a fairly old
(circa 1988) 520 STFM, and am aware of a problem with the handling of the
CTS line (it needs wiggling up and down by the device connected to it instead
of just detecting a valid low level)

Is there any way I can get around this (either by a software patch, or
a bit of soldering ??)

Hope somebody can help

Warren

PS Sorry if this has come up before, but I'm new to this group, and haven't
the time to wade through 20000 replies !

Couldn't you just blit it out of the "memory" device using a
vro_cpyfm() giving the handle of that device and a fd_addr of 0 in
the srcMFDB, just like you would to blit from the screen with the
handle of the screen device?

Or doesn't Atari's VDI work that way? That seems the logical method to me.

294. Perl 4.035 Port

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-20 04:00:10 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1993Jan20.040010.16912@csi.uottawa.ca>
Source record: 41048

Many thanks to Frank Ridderbusch for making the latest edition of Perl available on the Atari; I've been quite happily using 4.019 thus far, but gather that 4.035 is rather safer.

At one point, I attempted to compile it myself; it was a little too big for my machine to handle.

Question: Was it compiled with the GDBM libraries? I gather that it needs to be if one wishes to use dbm files with Perl. (I think THAT was the main reason that I attempted to compile it here at home.)

There's a copy of the library source (which probably needs to be compiled with -mbaserel and GCC2.3.3) on Atari.archive; I could never get any of the demo programs to actually work under either TOS or MiNT. Too bad... It looks like a nice little database system.

And one of these days I'm going to have to take another look at MetalBase; a C-based database system.

Source record: 41061

Thanks to everyone who gave me the required information on fitting a PC drive to my ST. I eventually got it working last night and am more than happy with it.

But I have another query...<groans from the audience>...when I try and format a HD disk in the drive to 1.44Meg the drive won't let me.. Is this the fault of my Atari? Or is it that maybe I picked up a Double Density drive.?

I tried using various third party formatters like FCopy3, DiamondFormat etc. etc. but still no joy.

Any explanation would be welcome..

Thanks in advance..

Craig

I'd be *very* surprised if you'd get the powerbook to lower itself to a broadcast monitor with 200 scan lines! Don't forget Macs don't have the pathetic resolutions where pixels aren't square, so you would have 320x200! I think the original classic Mac screens were even bigger than that.

:C) Even better would be a Point Of Sale software package I could use!

:Any help would be greatly appreciated

I have never heard of a barcode reader for the ST, but I presume you
could hook up virtually any device through some port or another, if you've
got enough experience. Unless someone can come up with a dedicated POS
package, or you are a hardware wizzard, I'd try another method...

My suggestion is to try using a handheld scanner. These are quite cheap
(UKP70ish) and usually come with complete support, often including info on
how to handle it from within your own programs. As I understand it (please
correct me if I am wrong), handheld scanners are uncannily similar to
barcode readers, and could easily input a bar code in just one swipe.

This would give you a mono picture of the bar code. You would then have
to write a routine to turn the bit patterns into the code number.
Alternatively, you could train/adapt an optical character recognition program
(often supplied with scanners) to read barcodes instead of writing.

i was considering doing exactly the same thing my self but for
sozobon C. GCC will do fine though (In fact better since I want
to compile gofer).

To create a .y file you need to use yacc (Should be on your sun)
Any chance of posting a copy when you've got it working.
(Unix uncompress please) In fact what you got to now will do if you post the sources as
well.

I'm not sure exactly where you'd look for barcode readers - perhaps check the classified pages in something like Byte/PC Magazine/Dr. Dobbs? Or one of the Electronics magazines?

>:b) Some way of interfacing the Barcode reader and the ST

Look for something that interfaces via RS-232, and it should be quite easy to interface it to an Atari ST. RS-422 might be acceptable - you'd need some hardware to translate to RS-232, though.

>:C) Even better would be a Point Of Sale software package I could use!
>:Any help would be greatly appreciated
>

>package, or you are a hardware wizzard, I'd try another method...

RS-232 would be by FAR the best way to connect.

The only major alternatives that are likely would be RS-422, or perhaps ACCESS.bus. I doubt that there are many "direct bus" connected scanners, because you don't need THAT kind of speed for a mere scanner.

I don't think there's any really EASY ways of hooking either RS-422 or ACCESS.bus to the Atari.

At the risk of getting flamed, I am not sure that the Atari would be the best platform for implementation of a POS system. It's FAR easier to get support for POS on other platforms.

A POS probably ought to use a single board computers/industrial controllers. Alternatively, there ARE manufacturers that make cash-drawers that are I*M compatible. That's probably a more effective platform for POS than the Atari.

In a previous article, adp@csg.cs.reading.ac.uk (Andrew Pollard) says:

>Hello world,
> I've just got the sources for GCC 2.3.1 off atari.archive and tried compiling
>a cross compiler on our Sparc1 at work (SunOS 4.1.1). It gets most of the way
>through, i.e. makes gcc, cc1, cpp, and a number of other executable files, but
>make crashes out with the error

I tried e-mail on this, but it bounced. Anyway, it sounds like you have
all you need to compile C programs.

>
>make: Fatal error: Don't know how to make target `objc-parse.y'

That means it's choking on trying to compile Objective C support. Has
anyone actually tried to compile/run an Objective C program on the Atari?
I sure haven't heard of any.

>
>Any ideas.....?

Another approach, if you really want 'everything', is to get the base GCC
2.3.3 distribution, apply the diffs in update27 and then compile. This
would be a good way to go, since objc-parse.y should be included in your
source distribution, but apparently isn't and you would get a more recent
version of GCC (with lots of bug fixes, especially in the C++ area).

By the way, you would run 'yacc' or 'bison' on objc-parse.y to generate a C
version of this file which can then be compiled by whatever C compiler
you're using to build GCC. So, if objc-parse.y is missing, something is
wrong and you need to either get it or at least get the Bison/YACC output
for this file.

>
>Also got the gnuutils off (ld, nm, etc) and I seem to be missing a file
>"st-out.h". What am I doing stupidly!

If you have instead a file called 'st_out.h', then just rename it to
'st-out.h' and keep going. Come to think of it, do you have a file called
'objc_parse.y'? :-) In this case, 'zoo' renamed the file for you.
Otherwise, it sounds like another missing file.

Contrary to what some people have been saying, there _is_ a POS program with
bar code reader and cash drawer for the Atari ST. It's called Cricit, I
believe, and has been available for several years (I remember always seeing
the ads for it in Atari magazines). If anyone wants more details, I can
track down a price/address/phone number.

From: ST32373@VM.CC.LATECH.EDU
Message-ID: <16B5C11D41.ST32373@VM.CC.LATECH.EDU>
Source record: 41068

I have an IBM Compat 386/33Dx. I would like to network it to the ST since I am soon to purchase a 212 Meg HD. Will the Falcon network to it and if so how much will it cost? It would be REALLY nice if the Falcon would boot from floppy so I wouldnt have to use a HD. (Buy). I used to have a 520ST and like the price/perf ratio, if not the company pracrtices/shortage of software...

Could someone _please_ send an ST binary of elm to atari.archive.umich.edu
or some other archive site? Please?

Has anyone tried porting rn to the ST w/UUCP?

315. SM 124 Size adjustment

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-21 05:33:24 UTC
From: tpearson@titan.trl.OZ.AU
Message-ID: <1993Jan21.053324.18188@trl.oz.au>
Source record: 41069

I know it is possible to increase the miserable size of the active display on SM 124 monitors. Does anybody know the trick? I have tried the internal horizontal and vertical size adjustments, and while there is no problem with vertical size, I cannot get the horizontal size more than about 2/3 of the screen using the inductor slug. Does anybody know why the active display area is set so small at the factory? Were they just trying to be as bad as the MAC?
Thanks for any help.

> 1.0, but 1.2 and up should be OK.

I think that the older host adapters will work, but that they only won't be
able to deliver the performance that the drive offers you. Since SCSI uses
an interlocked handshake scheme, the asynchronous transfer rate will be
dictated by the slower side of the transfer. With an ICD Advantage Plus ST
my Quantum hard drive does no better than 550 kB/sec, while newer adapters
can certainly double that (though this does not necessarily double system
performance for disk bound applications; seek time and latency dominate
data access time for random disk access).

Some SCSI devices (eg. a Wangtek 5150ES) have problems with the very narrow
(60-70 nsec with my 5150ES) ACK pulses provided by the ICD Advantage Plus ST
adapter, but this can be easily corrected by a small modification to the host
adapter.

Source record: 41087

Hello again from the man who knows virtually nothing about anything and everything about nothing.

Todays question....?

Having now installed a PC HD drive internally on my ST - with your help I might add - I am now left with this old, useless and lonely ex-internal ST drive, which has since sued me for not getting job satisfaction.

The question is...Is this drive now doomed to lead a solitary and neglected existence or is it's pitiful state to be relieved by using it as a second drive - externally.

Can this be done?

Answers on a postcard to...
Craig.

No you can't at the moment. This is a VERY non-trivial task. Coupled with this, the programmer involved has been working on it for over a year now. He needs to make a living, so this is how he intends to recoup his time.

>4 - The load up time stinks. I'm running TOS 1.4 off a Sysquest

> else I've seen. If the DA version (included in the full
> package) takes this long to load, I'd never use it... this
> (to my mind) is the biggest problem.

It takes roughly that time off a floppy drive as well. I didn't realise it took that time off a hard drive as well. I'll ask the author about it. I don't know how long the DA version takes to load on boot up, but certainly when I used it on subsequent runs, it pops up instantaneously, ready to go !

Any further feedback, gratefully received.

Additionally, apologies to everyone who has to use modems to download news, or who has to pay for it. This was a long posting and I was unaware of the existance of the binaries group. Sorry for the time wasted.

Cheers,

Danny

320. Re: MODPAS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-21 10:21:01 UTC
From: jhh@cwi.nl
Message-ID: <8694@charon.cwi.nl>
Source record: 41079

For your information,

I was rather pleased to hear that even someone not living in the Netherlands had heard of ModPas. It is a dialect resembling Pascal, but may be closer to Modula-2 (I don't really know Module-2, so...). It is a language based on seperately compilable modules, that can access things declared in other modules if they are in that objects interface. It has been developed at the Twente University of Technology and the University of Groningen, both in the Netherlands.

I have used this language almost exclusively for my own programming tasks, for it allows VERY structured programming. Besides that, the compiler has been ported to different platforms (I know there are DOS-versions, and SUN-Unix versions too). The compiler itself compiles to intermediate abstract code first. They also developed a code-generator-generator that will generate the code-generator for a specific hardware platform, giving a machine description of the hardware. This code-generator tries to do a lot of optimizing.

Because of the code-generator-generator, porting is really easy (I did a port from a SUN version to a HP-UX version in less than two weeks, without prior knowledge of the internal workings of the compiler). It's a clean program.

Now for the bad part: the last version I obtained was 1.0, some three years ago. I registered as a user, and was supposed to hear of any new releases or other news, but no, nothing happened. I suppose there is no new version. I believe the program is PD, but I'd better check this at home.

To warn you in advance, the compiler is VERY slow (it's a FIVE pass compiler). Also the actual code generated is not that fast either, because for some reason they have implemented a kind of shared module principle. This gives very small executables if you use a lot of standard modules that are already linked in the ModPas environment Shell (from which they then have to be called), but also incurs a huge overhead in calling functions from another module:
- first the base address of the module has to be fetched
- this module starts with a jumptable to all functions declared in it
- calling a function just does a jsr to the associated entry in the jumptable
- from the jumptable you jump to the code of the function

This seems to be unavoidable if you want to use shared modules, and do not want to resort to code modification (after one call to an external function, the actual code-address is substituted). But the optimizing code-generator somehow is able to balance the odds in most cases.

Also, there is not really much support for calling Atari-specific operating system functions. There are some modules that interface to the O.S., but they are incomplete. I have a few modules interfacing to the AES/VDI, but they are not really stable (not part of the 'official' release, you know).

If you're interested, I may be able to supply you with a copy (if it's PD of course). I tried Archie to locate it, but it doesn't seem to be on any archive.

Better be careful in adjusting the horizontal size. Increasing
the horizontal size requires increasing the ~14kV voltage. Your
monitor may not like that.

>Can your's?)

Uuhmm.. y're right. Sorry about the confusion - must have been a slip of the mind. Indeed, Cleanup only cleans up HDs and doesn't defragment them, and the PD-utility I mentioned did both, but ruined my HD while cleaning up (and not while defragging). I now defrag my partitions manually (move an entire partition to another, and move the files back again...). The advantage of this is that you have control over the _order_ in which files are stored on your HD. I always put .prg's first, followed by .rsc's, etc. Works rather well -- although I must admit that I wasn't able to use this method in the 30Meg-area. But now, with a 210Meg drive, this has proven to be a rather effective and safe method.
For cleaning up your HD I still recommend ICDs Cleanup though :-)

>
>Yes. Follow the steps below:
>
>- Remove the auto-booting ICD driver from the drive.

So hard-boot software is built in to TOS on the Falcon?
I assume it is Atari's own, in which case, doesn't it handle partitions
past the 4th one differently than the ICD software (Atari's original software
only supported 4 partitions, but 3rd parties brought out software that
supported more. When Atari brought out their new software, instead of adding
details of the extra partitions after the first 4, the bunged them at the
beggining of the 4th partition, making them incompatable).
Also, does Atari's software support full caching, removable media, etc. like
the ICD software? If not, have ICD updated their software to support the
SCSI-2 port?

>- Throw out the host adapter

Probably better to try to sell it.

>- Enable parity checking on the drive

So the SCSI-2 port does parity checking and all host adaptors don't. Are
there some hard-drives that use parity checking with no way of switching it
off (In which case, can it be disabled on the SCSI-2 port)? Otherwise,
does this mean you can now use ANY SCSI hard-drive?

>- Set up SCSI cable and termination as necessary.

Can you be more specific (although people could ask what to do in a PC
newsgroup I suppose).

>That's all.

Do you know whether the SCSI-2 port supports clock speed doubling (I know
it doesn't support 16-bit width).
It was initially suggested that the old DMA port was available as part of
the SCSI-2 port - do you know whether this is true? There don't seem to be
enough wires, so perhaps it is software switchable (or emulatable).

Other people have mailed me saying that it is just an variable oscillator using the resistor in a joystick etc. as the variable part. The pulses from this are then just counted. Still it was a nice idea while it lasted :). Still, I can now try and connect my old Atari Touch Tablet up... should be good for a laugh !

Thanks for the help

326. Problems with Sun-3 Shoebox Hard Disk Project

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-21 11:58:56 UTC
From: ralph@laas.fr
Message-ID: <RALPH.93Jan21125856@cubitus.laas.fr>
Source record: 41076
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.sun.misc,alt.sys.sun,comp.sys.misc

I am trying to interface the shoebox from a Sun-3 workstation to my Mega 4 ST. Unfortunately, I do *not* have any docs on the Sun-3 shoebox.

I am using an AdSCSI host adaptor and I have both ICDBOOT 6.0.2 and 6.0.3. ICD sees the controller and reports:

0 EMULEX MD21/52 ESDI

The drive is a Micropolis 1325. When I power up the shoebox LED 3 of the Emulex controller blinks. What's the significance? The drive sounds like it comes up fine. When I call ICDFMT is sends out a sensing signal for SCSI devices, and the diode light on the front of the drive flashs but ICDFMT does not get an answer.

Has anybody done this before? Any suggestions? Do I have to play with the jumpers and what do they all mean? Is the shoebox SCSI connector terminated with a resistor pack?

Thanks to all! Of course, I'll post a summary for any e-mail replies I might get.

From: entropy@gnu.ai.mit.edu
Message-ID: <ENTROPY.93Jan21074718@kropotkin.gnu.ai.mit.edu>
Source record: 41077

OK, I finally bit the bullet and ordered a Toadfile '91 Magnum removable HD system. I've got a few questions so I know what to expect when it arrives.

I've currently got a Megafile 30 with a Seagate 60 meg mechanism in it.

I'd like to hook up my system so that it continues to boot off the Megafile as drive C, since I will be using several different carts in the Toadfile (source code, apps, backups, will be on separate carts).

The Megafile currently boots with AHDI 3.01. I'd like to run it with the ICD software instead, so I plan to boot with the Toadfile, copy the contents of the Megafile onto a cartridge, format the Megafile with ICD software, copy everything back to the Megafile, and then reconnect the Megafile as the boot device. (Am I correct that the first device in the DMA daisy chain is the boot hard disk?) The question is, will my AHDI-formatted Megafile be accessible while I'm running the ICD boot software, or will I have to do a backup/restore to floppy to get everything copied over?

Also, will I have to diddle any switches to hook up both drives at the same time, or does the DMA bus automagically figure things out from the order in which they are cabled to the machine? Will I still be able to access the ICD adapter's internal clock if the ICD adapter is second in the chain?

Thanks,
entropy

p.s. mail or news replies equally OK with me

|> If so I might get one of those as a replacement.

Hello Steve,

perhaps ou understood something wrong, but the normal 53C80 is the SCSI-chip without 8530 in
the TT but you are right, that there are circutes, which have implemented the 8530.

But there's a much easier solution. Someone in our MausNet pointed out, that there is
a newer 85230 which is also pin- and soft-compatable and have more buffer than the normal
one. As I can remember it was something above 6 bytes.
And now AMD, too, offeres a even newer version of the 8530 which will have even more buffer,
but I've no more informations about this chip.

329. Blitter s/w problem.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-21 14:12:57 UTC
From: alexk@essex.ac.uk
Message-ID: <7634@sersun1.essex.ac.uk>
Source record: 41082
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a problem using the blitter chip. The blitter appears to be drawing to what it thinks is a med-rez screen when it is in fact a low-rez screen. Ihave used XBIOS call 5 to set the rez, and screen addresses, and is called every time I page flip. Does XBIOS 5 tell the blitter the number of planes to use? I booted the machine in low-rez and ran my bit of code straight away but it still thinks it's in med-rez.

I used ST Internals for my source of info, and it doesn't tell you to set _v_planes (first byte of bitblock), should I? My machine is an 'early' 1040 STe.

Thanks,

K.A.

Me too, and it is a nice looking bit of software though I couldn't play too deeply as I have a Kawai K4 and when I phoned Waterfall Digital re availability of a K4 module the phone went unanswered..
The price is good too and compares very well as it's a once only product for all the synths you have modules for, perhaps they supply the module of your choice for the basic price and then a fee for extra modules as I'm sure we don't ALL have TX81z or U110 as supplied with the demo.

>4 - The load up time stinks. I'm running TOS 1.4 off a Sysquest

Im running TOS 1.6 and a floppy and it took about as long, I thought the program had hung ! There's no need for a 1.5 minute advert for Waterfall Digital every time you run the thing !! A BIG no-no.

Other niggles.. there are some annoying inconsistencies in that some sliders diplay the numeric values while other sliders / dials don't, this could be a pain where guesswork just isn't quite good enough. How about some calibration instead of those great big arrows, or even a pop up value display whenever a slider / dial is adjusted.

I didn't much like those enormous horizontal selection buttons. Functional, but for a graphical editor hardly elegant. A lot of this stuff would be much better accessed from a menu bar IMHO.

However, I really liked the mouse driven control of sliders and dials and editing of velocity/keyscale/filter curves and also setting of keyboard zones etc instead of just using it to increment decrement values, much more like real "control panel".

The authors make no reference to testing alongside popular sequencers, CUBASE springs immediately to my mind :-> Im going to keep trying the phone no. and hit them with all the above before I invest.

The device which it boots off is always device number 0, no matter where the device is in the chain. So be sure you give your Toadfile a device address different from 0. (To be more correct: It boot from the first DMA device it can read and execute a boot sector from.)

The ICD software is compatible to AHDI, so you will be able to access your AHDI-formatted partitions while running the ICD driver.

I think it's not nessecary to boot from your Toadfile. You could install the ICD booter on your Megadrive and then boot from it. In this case, you would not have to change your Megafile's device number (which, as I heard, is even impossible with some older Megafiles).

> [...] Will I still be
> able to access the ICD adapter's internal clock if the ICD adapter is
> second in the chain?

Yes, you will. The ICD host adapter's clock is device number 6 and can always be accessed, no matter where it is in the chain.

The 1325 is an MFM drive, not an ESDI. You could use an Adaptec
ACB4000 to run the 1325.

If you had a 1355 drive, that drive *is* an ESDI drive, and would
work with the MD21.

>The drive is a Micropolis 1325. When I power up the shoebox LED 3 of
>the Emulex controller blinks. What's the significance?

Well... the 1325 is an ST506 drive, not ESDI. You would need an Adaptec

ACB4000 SCSI -> ST506 controller. The green LED on the MD21 blinks when

operations are normal and it is connected to an active SCSI port. So,

either get a ST506 controller or an ESDI drive and you'll be all set!

Source record: 40995

Hello all, long time no see....

Well I finally have my BBS software written and now am contemplating
some serious disk space.

I would like to know, if anyone has hooked up a BIG 200meg plus scsi
drive to thier MEGA STE system, specifically:

1) Can the measily 80Watt power supply handle the startup sequence?

2) Did you have to put the drive and mother board in a seperate case?

3) What software do you find best to use on it? (IE Supra? Atari? ICD?)

And, what kind of performance do you get with the ONBOARD SCSI in your
MEGA STE?

I am looking at MAXTOR's 330MEG SCSI for my MEGA STE. I would hate to blow
that size of a wad and then find it won't work.

-Greg

PS: Oh yeah, BBS number almost forgot: 608-238-7231...call and play games
send mail...no file base yet, haven't gotten that far...I don't even
have the drive yet!

The board software is called ACICS. Node is: acics.uucp.

The normal floppy controller fitted to the ST cannot cope with High Density disks. The solution is to get either a HD-interface (I think System Solutions in the UK sells it), or the new Atari floppy controller - AJAX - but I'm not sure if it will work with a standard ST.

However, the HD-interface I have fitted to my MEGA ST1 required a fair bit of soldering.

FCopy Professional from the ST Club and Harlekin 3 are two programs that can format High Density disks. The new TOS 2.06 would also be of use but it's not a requirement.

I hope this info will be of use.

It should not be a problem to use that disk with your Mega STE. If the Atari software does not find the disk, try using GE-Soft from Germany. The ICD will not work if you do not have the pro version.

You will have the same speed as connecting it to an ext. case. The controller in the STE is not true SCSI, but ACSI to SCSI converter, as all other SCSI controllers from 3rd party. The controller actually comes from the Stacy. AND it is not possible to hook up 2 or more drives to the controller as it is possible on true SCSI or controllers from other 3rd party companies.

>Does anybody know how to generate random numbers on a computer? I know
>of the GEMDOS/BIOS/XBIOS call that does that, but I wonder if it could
>be done faster?

The XBIOS call uses the "linear congruential" method of generating pseudo-random numbers, which works as follows:

R(n+1) := [R(n) * a] mod b

(Where R(n) is the n'th random number, R(n+1) the n+1'th number, etc)

The idea is to choose values of a and b such that long sequences of non-repeating pseudo-random numbers are obtained. From a computational viewpoint, it makes sense to make b a power of 2 since the modulo function then reduces to a simple AND instruction. There are also rules for choosing good values for a.

The XBIOS call is pretty quick -- it's an assembler implementation of the above, and you're not going to write one that's much quicker! The thing that takes the time (on a 68000 at least) is the multiplication. There are other methods that use shift-then-XOR (see the book references below).

I remember (it's a long time since I disassembled the code) that when the XBIOS routine is first called, the generator is seeded with a new number -- but I forget where that number comes from.

>I'm supposed to do a program that has to do with
>probability and such things, and I'd like a fast and flexible random
>routine in assembler.. so if anybody has ideas, they're welcome!

If you want *truly* random numbers (as opposed to pseudo-random numbers), then you're going to have to build some hardware. Commercial random number hardware works by amplifying the quantum noise in a resistor and thresholding it to generate a stream of random bits.

There is quite a lot of literature about random number generation. You might look at the "Numerical Recipes" book by Press, Flannery et al. (but it has some mistakes in the section on random numbers). Any good numerical algorithms book should cover random numbers -- Sedgewick's "Algorithms" has a small section on it (and it covers the shift-XOR method).

The only way is to read ASSIGN.SYS.
You'll find it on your boot partition.
There is a global variable whitch says what's your NEXT boot partition,
but that's equal to the last boot partition in most cases.

You don't want MODPAS: when I treid to use it it seemed very sub-standard (as opposed to Turbo's super-standard) and all the docs will need translating. Unless there is a new version I ain't heard about.

> fledged commercial version!
>
> (I probably could afford one, but finding one is a different matter!)
Prospero do a pascal don't they? As do Hisoft.

Hi people,

Now here's a bloody simple yet personally rather irritating problem:

Shortly I ran into the Freeze Dried Terminal Program.
Lotsa features included, quite impressive I'd say,
(though some call it a dirty hack or complain about it's coop with Mtos)

and it cooperates just fine with nn and elm.
IRC though is a problem: The first screen after running irc
is printed okay, as well as the inverted status line,
yet ALL THE CONSEQUENTIAL data get's printed at one and the same line;
the one jright above the status line.

WANTED: * Settings from a fellow-fzds & IRC user !!

Hope to hear from you soon,
Please only mail to: at073@cleveland.freenet.edu
, for postings dont last long on our system ..

Thanks in advance!
Rowdy Blokland.

353. MiNT incompatabilities & TCSH problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-22 16:20:48 UTC
From: dud@hardy.u.washington.edu
Message-ID: <1jp6t0INNdoi@shelley.u.washington.edu>
Source record: 41007

I've been having compatability problems with MiNT... My first sign
of the problems was lack of filename completion in TCshell. The
machine always locked up. Then I noticed whenever I did a "Find" in
STeno, it would lock up when it couldn't find anymore strings. I was
getting phantom lockups all the time. Then it clicked... it was the
bell! I turned off the bell in the control panel, and that fixed it.
But I was curious to see what caused it. At first I thought it was
TCSH, so I closed it in TOSwin and saved TOSwin's configuration.
Then I began rebooting with different configurations...

These are the things I found out.

The following refer to the bell problem, which I tested after each reboot
by bringing up an alert box and clicking off the edge (so as to make the
bell sound) and seeing if it locked up:

1) TCSH is not the problem

2) TOSWIN is a problem. Everything works great when I don't have it
running as an accessory. It's OK when it's running as a program though.

3) Warp 9 control panel accessory is a problem. Everything works great
(including TOSwin accessory) when Warp9 cp is gone.

4) STeno accessory and UIS3 program are problems when Warp9 cp is
installed. Works fine with Warp9 cp unless either of these is running.

5) Of course, everything except TOSwin works without MiNT.

The filename completion problem is totally separate; when the bell doesn't
lock the system up, it still doesn't work. It just dings the bell &
accesses the hard drive.

Man, I've never had this complex of a problem! It'll be a nightmare to
sort everything out. I'm sure MultiTOS will fix it, because a) I can run
toswin as a program, b) it will have a new version of MiNT, and c) it will
replace most of TOS, possibly changing the way the bell rings. I sure
hope they get it out quick!!!!

Has anyone had similar experiences? Probably the worst problem is
the lack of filename completion in TCSH; the incompatabilities can be
worked around. Is there an entry in tcsh.rc that affects how TCSH
uses filename completion? Filename completion worked fine before I
reinstalled everything with the MiNT distribution kit...

^^^
The "linear congruential" method typically involves an addition as well as
a multiplication (using modular arithmetic).
My docs say that R(n+1) = [R(n) * a] + b using fixed-length (presumably
long) operations to make everything mod 2^32 or whatever. FYI, a = 3141592621
and b = 1. In addition, the OS call returns R(n+1)>>8, which gives a
24-bit pseudorandom number.

In most cases, it's a switch on the backside of the harddisk's case. (My external drive, for instance, has an id selector which shows the current id and has a `+' and a `-' button.)

> Will ICD Cleanup be able to cope with the AHDI partitions?

Yes, it will.

This is definitely true, all screen savers I've used (even Atari's MACCEL3) do not work properly with a MIDI device turned on. It thinks the MIDI clock info or whatever is coming in is keypresses or mouse movements, and the screen never blanks. This is annoying.

A friend recently went into a regional chain store (toys? pets? I forget) and it was running a midi networked ST POS. Also there is at least one company that does POS for both the PC and the ST. If you need more info, I could contact my friend and raid the archives for the names of 1) the chain with the system and 2) the company that sells the ST POS s/w.

The nearest Atari Dealer is over 100miles from where I live! And they only sell a couple of games, and that's it!

Atari in this country is (annoyingly) about 90% dead! So, unless I can get a Shareware/PD PASCAL (of which MODPAS is the only one I've been told of), I would have MAJOR difficult getting one!

If I did, the cost would almost double due to postage costs!

Switches for HD's can be inside the casing. Or outside. They can
be DIP switches, or jumpers. (Usually consisting of a metal clip,
encased in plastic, which plugs onto the protruding pins.)

If you can't see them, there's a pretty good chance you'll have to
get out the Screw-driver & look at the drive unit itself!

Hello, I just got my new high speed modem. It works great, but occasionally will loose text on long screen dumps, etc. I have tried XON/XOFF and hardware handshake, but neither seems to help. I have this same problem in both Spectre and Mac (Spectre GCR) modes.

How do you folks with Fast modems have your comm. programs setup?

I am using Uniterm with a 1040stf (old) and Digicom Scout Plus modem.

(I have same problem in all programs that I use in both Spectre and Mac mode.)

thanks......

As long as Atari are not producing good documentation at a realistic
price I hope that their user-base will be able to help me.

Is there a complete specification of the cookie jar mechanism available
on the net anywhere? I am particularly interested in the details of
installing and maintaining a cookie jar on a machine where the jar is
not supported by TOS.

Please note that I am not looking for a program to do this for me, I want
the details of how the jar is initialised, operates and is removed.
A complete and up to date list of the cookies that one could expect
to find in a jar would also be really good.

Thanks ever so much,

Neil Smith.

University of Ottawa | Genius may have its limitations, but
Master of System Science Program | stupidity is not thus handicapped.

Yeah, this perl 4.035 was compiled with GDBM 1.5, also ported by
J.R.Bammi (should be available on a.a.u.e). I don't know, if you
already know GDBM, but don't expect anything heavy in term of database
functionality. There is essential nothing more, than the associative
arrays in perl, which can be bound to a DBM file. Metalbase offers
much more functionality, compared to real database management systems
(what I've gathered from the README).

> I'm still hoping to hear someone say it works well with PageStream...

It does!

It also works with STalker, and 90% of all those other window-based
programs (you can stretch the window over the extra space).

FZDSTerm supports it, gives you more columns/lines on the screen.

Spectre-GCR, unlikely, but perfectly possible!

Uniterm/Flash, no!

Basically, anything that will run on the TT in one of the TT res's, will
work under Over-scan. (And most will use the extra space). Not a very

good reason there, but one that will work in many cases! 8-)

Using 9600bps or higher, on Atari's, requires the program 'SERFX'
(or whatever it is). 'Serial Fix' just adjusts the Handshaking,
so it's a bit more stable!

(It works - if you don't have that, or Turbo-CTS, then get it!)

Should be available at all good FTP sites!

I got the size of the visible area on my SM124 up to the edges of the screen almost. I got directions from an old ST Report (ZNet?), Ican't remember. Anyway, there are vertical and horizontal controls inside the case that can be turned with a screwdriver (be careful, HIGH voltage).

374. Spectre with 14.4 modem -- Handshaking?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-24 02:59:50 UTC
From: yonder@netcom.com
Message-ID: <1993Jan24.025950.25281@netcom.com>
Source record: 41029
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

thanks to the folks who suggested that I use Serfix on my St.. it worked great to solve my handshaking problems with my new faster modem.

My next question is how can I get this same clean handshaking when I am using my Spectre GCR. Handshaking does not seem to work under Spectre either.

Can anybody suggest anything? Does anybody else have this problem?

.......thanks......
.....chris

P.S. I use Z-term primarily, but I tried others and had the same handshaking problems. My modem is a 14.4 baud Digicomm Scout Plus modem. My ST is an old 1040STf with old ROMs. My Spectre is version 3.0.

I think the problem may be that the Micropolis 1325 is an ST506 device,
and the MD21 is intended for controlling ESDI devices like the
Micropolis 1355 or 1558... The controller you need for the 1325 is an
Adaptec ACB4000 or equivalent...

CF> I was writing a TSR and couldn't figure out exactly why it was
CF> bombing. Is it okay to use the PC in a VBL?

Of course. PC-relative addressing ALWAYS works, but if those BVL routines
are just started from within a normal program that gets relocated, not from
the bootsector or something, you don't HAVE to use PC-relative addressing.

But you cannot use any system calls from within the VBL and you should save
all registers that you use before your routine and restore them afterwards.

Ta!

380. Devpac 3

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-24 21:55:04 UTC
From: gbcusg@gpu.utcs.utoronto.ca
Message-ID: <C1Dovt.688@gpu.utcs.utoronto.ca>
Source record: 41035

I recently purchased Devpac 3 for my ST. Upon installation, I ran into a problem, however. Every time I try to assemble from inside the editor I get a message saying 'Invalid Command Line - see manual'. I consulted the manual and of course, that error isn't even listed in the appendix that explains all error messages. I can run the assembler itself from a command line, however (tcsh) but this is not what I want. I would appreciate any input, or alternatively an e-mail address for Hisoft.

381. Need PC DITTO II technical info

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-25 00:06:39 UTC
From: bcc@lanai.Eyring.COM
Message-ID: <1993Jan25.000639.29334@fcom.cc.utah.edu>
Source record: 41036

When Avant-Garde went belly-up, they orphaned a product that worked. I have had some success disassembling the binaries and patching them to do a little customization, but it would really help to have some of the technical spec on the PC Ditto II hardware and/or software. Does anyone have information on either on these, either from the original company or through reverse engineering? What is the legal status of a product after its originator abandons it? One of the things promised when we bought PC Ditto II was that there would be software upgrades. Obviously, we can't get blood from a stone, but if the technical info were released to the public domain, it would be nice. Or am I the only one left who still uses an emulator instead of a cheap PC?

I don't think it's VT100 emulation (does it exist? or is it VT52?) is very good... that's probably your problem, you need good vt100 at least to use IRC, dump FZDT & use VT200 in either UNITERM, or CoNNect. (both shareware)

383. MiNT 0.99 source on atari.archive.umich.edu...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-25 01:43:01 UTC
From: anneklin@acs.bu.edu
Message-ID: <108166@bu.edu>
Source record: 41037

Is this an 'official' release? Should I be using this?

I just got it today, and compiled it and such, but now I'm curious as to its status, because I've noticed that there's some omissions and some things that I'd expect to be there aren't (the two are different).

For instance, asm.y isn't in the archive at all--an omission, though not a tragic one, since the binaries that it produces are already compiled for you--not that that stops the makefile from trying.

Also missing is any sort of documentation--not even the strong cautionary documentation that came with 0.96B, which is what I expected to find, since this seems to be another source-only distribution.

Eric? The verdict? Is it something that shouldn't be touched, or were you just in a hurry? :-)

Mike.

384. Re: MiNT 0.99 source on atari.archive.umich.edu...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-25 03:58:03 UTC
From: ersmith@netcom.com
Message-ID: <1993Jan25.035803.18930@netcom.com>
Source record: 41039

In article <108166@bu.edu> anneklin@acs.bu.edu (Patricia Anne) writes:

>Is this an 'official' release? Should I be using this?

The answer to the first question is "sort of," and the answer to the second one is "that depends on how lucky you're feeling" :-).

I was in a hurry; zillions of people have been asking for updated source, but I simply haven't had time to do a 'real' release. So I threw together the files from my directory and sent them up. In the process I left out asm.y by mistake; and the usual README file didn't get written. Sorry about those omissions; I will try to correct them, but it will be some time before I can get a real, organized release including the Lattice and PureC support, plus docs. MultiTOS is consuming an enormous amount of time; as with any software project, the closer it comes to release the more urgent are the bug reports.

So consider this an "interim" release, for people who just can't wait and who don't mind risking life, limb, and hard disk while testing new software :-).

Also: as Mike pointed out in his message, this is also a source code only release. Please observe this restriction. As beta software, MiNT 0.99 is suitable for use only by experienced programmers, and I *don't* want people misunderstanding its status at all. Moreover, this release contains Atari code as well as my own, so observing the restrictions on distribution is doubly important -- how well people respect the conditions will determine whether or not we will release future versions of the MiNT source code to the general public.

Regards,
Eric

The active display is set by the hardware in the Atari and not the monitor, try the Overscan mod and find that out...

But some screen are smaller that others, my SM125 is far larger than any SM124 that I have seen and my SM125 is that same as it left the factory...

Lack of screen size is because Atari decided that the ST was only going to be used on a TV, the boarders are far to big, but the mono mode does not run on a TV, but that is why Atari is just a dumb company...

h> you only have TOS 1.0, but 1.2 and up should be OK.

grin well, I _was_ planning on connecting it to a TT, so I hope that's OK.
8)

And I must also admit to a major numbering faux pas. Never having met the larger Maxtors before, I assumed that this was one of their 7000 series drives, and that the person I was buying it from has simply transposed the digits in the part number. Infact the drive is a Maxtor 8760S.

Sorry for any confusion, and thanks for the suggestions.

After the help I received from this conference on installing a PC drive in my ST a question sprung to mind.

Why don't more ST owners install cheap PC drives.??

The PC HD drive I got cost me 33pounds inc. VAT. new. Which when considering the price of an ST HD drive is quite a saving. Is it because ST owners aren't aware of this cheap source of drives that they don't use it?

Answers on a postcard to someone else please..

How about a pair of thick gardening gloves? Worked for me, anyhow!
There are horizontal & vertical size pots, a focus (you can't get perfect focus all over the screen when its big!) and a kind of ratio thing that seems to magnify part of the screen vertically if you get it wrong.

Run a simple program or something to show a couple of diagonal lines on the screen while you do it so that you can see you've got the proportions right. The pixel w/h ratio won't be the same afterwards though.

I couldn't go back to a mailbox sized screen again!

David.

I am pleased to hear that I was right. BTW, I am currently working on a screen saver myself which has some handy features.
1) Works in all graphics modes possible (in theory)
2) Uses sliding block type screen saver when memory is low and jiggles the blocks back into place when finished.
3) If the machine is busy (eg. you are compiling something in Lattice C5.5, then the screen saver will not lock up the computer. Instead it blanks the screen and lets the machine multi-task until it becomes idle, when it unblanks and goes back into normal screen saver mode.
4) Is unaffected by programs that steal the ikbdsys vector or MIDI input.
5) Comes with a corner clock that switches off while the screen saver is active.
6) Configurable via CPX.

I'm not telling how I do no. 3 because it's rather clever (although probably easy in multi-tos) and I want my screen saver to be the only one worth having.

I will post my disassembly of the IKbd handling by TOS once I have copied onto the unix machines here.

Yes, but if you don't have a hard drive, the fonts may be on floppy,
so you have to prompt for them. Also, you can't guarantee to have the
ASSIGN.SYS file present. What I want to do is find some way of
knowing whether the fonts are on a hard disk (i.e. drive >= C) or on a
floppy. GDOS must store this information itself somewhere, so surely
there is a way of reading it.

ST-Blank does check to see if the IKBD really caused the interrupt (I checked the source at the weekend). I also fixed the bug that caused the AUTO folder program to crash if there was no .INF file -- I'll be uploading the updated version sometime soon.

This has been a public service announcement... :-)

QED - not. While you are right that GDOS must store the information somewhere, this does not imply there is a way of reading it.
I think you mean there SHOULD be a way of reading it, which is debatable in itself - what do you want to know where the fonts are stored for? If you are writing a program that by-passes GDOS for font handling then DON'T - Speedo GDOS will be out soon with scalable fonts and faster bitmapped ones so your effort will be wasted.
If you really need to find out where the fonts are stored (and I'd be interested to know why) then the previous answer is the best you are going to get. Your problem with not being able to find ASSIGN.SYS on a floppy system is invalid because the ASSIGN.SYS file must be on the same disk as the fonts, and you'd have to prompt for the fonts disk anyway, in order to access them.

As of Spectre 3.0 (or whatever is current), the overscan mod _doesn't_ work. It works fine with several Atari programs, but not at all with Spectre. There seemed to have been something mentioned long ago in one of Dave's newsletters about someday supporting it, but nothing has happened so far. I wrote him a letter pleading for overscan support... I would suggest all other interested parties do likewise (we can only hope).

SM124's have a tendency to give an (even) smaller picture as they get older.
I understood that you can adjust the as such marked pots (size) but that
you shouldn't try the increase the High Voltage cause the monitor might
blow up.

Date: 1993-01-25 16:53:24 UTC
From: lenn@mentor.cc.purdue.edu
Message-ID: <C1F5L1.K0@mentor.cc.purdue.edu>
Source record: 40955

I am looking for a used 1040STe, with TOS 1.62 or 2.06.

I will consider any RAM configuration.
I only want the computer and mouse and the owner's manual.
I will pay a very fair price.
Obviously, the computer should be in perfect working order.

I will consider STe's with other upgrades such as AdSpeed etc.
and will pay accordingly for the upgrade's value.

Thanks in Advance,
Jody Lenn

Source record: 40966

Lost Boy (mm68@unix.brighton.ac.uk) wrote:
> Can anyone tell me how to read in the BIOS boot sector paramter from a floppy
> disk and how to access the value of it in C? I am having loads of trouble,
> getting spurious data, or hang-ups!

In Pure C/Turbo C, you just say:

```
#include <tos.h>

[...]

BPB mybpb, *bpbptr = Getbpb(drive);
if (bpbptr)
{
memcpy(&mybpb, mybpbptr, sizeof(BPB);
/* read the values in mybpb */
}
```

'drive' is a BIOS drive number, and BPB is a structure declared in <tos.h>;
the name of the include file and the names of the structure elements
might vary depending on the compiler you're using.

Note that it's possible that the system reuses the space that 'bpbptr'
points to when Getbpb() is called for the next time, so it's not
safe to assume that every drive has a dedicated BPB somewhere in the
system. I know of at least one version of AHDI that allocated only
one BPB and filled it with values whenever Getbpb() was called
for a drive on a hard disk. That's why the code fragment above
immediately copies the BPB to a safe place. This won't help,
however, in a multi-tasking environment where taskswitches could
occur between the Getbpb() and memcpy() calls. I think this old
AHDI's behaviour in this respect is unsafe. I don't know about
current AHDI versions, though.

> Also, I have written a formatter which uses interleaving (factor 11) but
> when i use Quikdex I get a performance drop to 48% from the usual 97%!!!
> Any idea what I am doing wrong?

A generally good advice on QuickIndex' disk throughput values might
be to ignore them and write your own tests 8-), but in this
case you've probably spotted a real problem in your program.
Are we talking 9- or 10-sector formats here?

Message-ID: <1993Jan25.182625.18292@sol.ctr.columbia.edu>
Source record: 40957

More updates for the MDK. Disk1.zoo has been changed yet again. This time though the changes are more for useability than bugfixes. The INSTALL program will now happily cope with more than one .sys file on the same floppy, so you can easily install more than one update at a time.

The latest version of the GNU shellutils is also available in Updates\ with a few new utilities in there.

I haven't been able to log into a.a.u.e to upload this, but it is available for anon. ftp from phlim.ph.kcl.ac.uk and will be uploaded to a.a.u.e as soon as I can actually log on. (I've been trying all day...)

I'm still sticking to the original MiNT 0.95p13 binaries that have been available from Eric for some time now. There'll be a later patch with all the 'b' utilities for sharable text stuff as soon as there is a public version of MiNT that supports it.

Simon.

You shouldn't do this.Increasing the size of the screen often goes with
increasing the voltage on several component's in the monitor.Atari has
stated that increasing the screen using the potentiometers in the SM124 can
kill the flyback unit after some time.

409. Advantages of TOS 2.06?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-26 02:12:43 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <1k26mrlNN13hj@rs1.rrz.Uni-Koeln.DE>
Source record: 40962

Hi Atari tech folks,

there will soon be a chance for me to get my 520 STfm, which currently has 2.5 MB and TOS 1.04, upgraded to 4 MB and TOS 2.06 at a reasonable price. While I'm most determined to go for the 4 MB upgrade, I'm not so sure about the TOS 2.06 one. I am not sure whether there is any major advantage of TOS 2.06 that I can't have with TOS 1.04 and the standard patches.
I'm not looking for info about the TOS 2.06 desktop or such -- I use it every day at work. I am interested in technical details in the internals that may not be obvious to someone like me, who uses the ST for GFA programming, GNU C programming at beginner level (hope that's going to change in the future :-), terminal emulation with UniTerm, word processing, playing, and some other stuff.
Currently, it seems to me that TOS 2.06 offers a lot more convenience than TOS 1.04, but there's not any major difference between TOS 1.04 and TOS 2.06 at the level of OS functionality. But since I'm not the OS hacker type, it's quite possible that this is not correct, hence my question.
A question that comes to my mind is, a while ago I was told that the TOS 2.06 expansion card was designed to be able to be equipped with MultiTOS ROMs in the future. Could anyone comment on that?

I will post a summary if I receive interesting mail replies on this posting.

Greetinx & thanx in advance, Jan

```
> ....maybe someone can verify for me how accurate this statement is:
> "vt102 and ANSI use the same cursor-controls; only the graphics
> characters are different" - I should be reasonable close...

VT102 & VT100 are quite a bit different!
```

Essentially, as you say, the cursor controls, and other key controls
are pretty much identical. The graphics commands, are not! They
use slightly different character sets. Such as, if you are using
ANSI - then this: ♦ will be something resembling a inverse +
in VT100, it will be something quite different!

```
The VT100/VT200 etc. vertical line, results in an Atari symbol in
ANSI mode etc. Trying to use IRC, and other graphic-command intensive
stuff, is not a good idea unless you are using the correct emulation!

(Screen clearing codes are also slightly different, as well as assorted
others....)

Basically, if you are using IRC, use Uniterm or Flash. (Or, if you
have a fast computer, Connect, or STalker....)

And once again my inquisitive mind gets the better of me and I am forced to seek advice.

I have heard news that Atari - or some other developer - is developing a couple of boards for their Falcon that will emulate a PC perfectly. Are these rumours true or false? What of the cost?

If these rumours are true then it may be the saving grace for Atari. PC's are going to be around for years to come. Getting out a machine that will be completely compatible makes good business sense.

Craig

>reinstalled everything with the MiNT distribution kit...

The problem is quite simple. TOSwin has to do something to output a bell, so it does a Bconout(2,7). Somehow that gets redirected as well, and if it gets back to TOSWIN (this might be just a mistake), you simply get a stack overflow in the end.

Notice that Mupfel has its own bell sound routine, although it sounds the same. When I have my bell-hook sample program installed, and the Mupfel console is open, the old bell sounds. When I close it, the new bell sounds. Therefore I think TOSWIN-likes should do a similar thing. It would be very nice as well: every program having it's own kind of bell sound, so that you know what's wrong just by the kind of sound you hear :)

Source record: 40968

I have been using the osbind.h header with several programs lately and I have noticed that (in v1.33i) at least, many of the macros are wrong! They are cast to void returns when in fact there are long returns! This causes all manner of roblems when trying to pick up returns from these calls.

Just though you might like to know. It is a real problem with such a good compiler and all, I was most suprised.

>
>- Leo

My reason for wanting this is quite simple - if someone has their fonts on a hard disk, there is no need to prompt, so they will get annoyed if prompted for a floppy. On the other hand, with no HD, you NEED to prompt. IT IS NOT TRUE that the ASSIGN.SYS file has to be on the same disk as the fonts - it only has to be in the root directory of the boot disk - the fonts can be on a completely separate disk. (if you don't believe me, try it!) Therefore - I cannot rely on it being present to check the PATH.

I have no intention of bypassing GDOS - I just want to use it exactly as it is!

I'm working on it, but it has broken under the memory protection from MiNT 0.98 and above... now if only I had a symbolic debugger which could debug grandchild processes :-)

Steve

PS. GDB is fun under MiNT... when you kill the process being debugged it stops MiNT and reactivates the process which started MiNT... very nice!

420. Trouble with GNU-make 3.62

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-26 14:58:07 UTC
From: kd@cs.tu-berlin.de
Message-ID: <1k3jhvINN491@news.cs.tu-berlin.de>
Source record: 40975

Hello,

I am having some trouble with GNU-make. I finally persuaded make to do what it should, but I had to use some weird tricks. So would you please look into the following makefile and tell me whether I made a mistake or whether I found a bug in one of the programs involved.

The general idea is that I want to build a program 'zoohdl.prg' from a source 'zoohdl.c'and several libraries using the Pure C Compiler.

```
--------------------makefile starts here--------------------
SHELL = \bin\tcsh.ttp

CC = pcc
INCLUDE = \gnu\include
CPPFLAGS =
CFLAGS = -I$(INCLUDE) -C -V

LINKER = plink
LINKERFLAGS = -S=0 -V -O=$@ $(START)
LIBDIR = \f\p.c\lib\$(empty)
START = $(LIBDIR)crt0.o
LIBS = acs pcgemlib mintflt mintlib pcstdlib
XLIBS = $(addprefix $(LIBDIR), $(addsuffix .lib,$(LIBS)))

zoohdl.prg : zoohdl.h zoohdl.o
cd $(PWD);$(LINKER) $(LINKERFLAGS) $(basename $@).o $(XLIBS)

zoohdl.o: %.o : %.c
cd $(PWD); $(CC) $(CPPFLAGS) $(CFLAGS) $<

.DEFAULT:
echo $@ -- Default-Rule!

%.o : %.c
cd $(PWD); $(CC) $(CPPFLAGS) $(CFLAGS) $<

--------------------makefile ends here--------------------
```

(1) If I call make with no further options I get the message

```
make: No targets specified and no makefile found. Stop.
```

If I call make with -fmakefile (i.e. 'make -fmakefile') everything works.

(2) As you can see above there is a static pattern rule zoohdl.o: %.o : %.c If I remove this rule (and touch zoohdl.c) and call 'make -fmakefile' I get the message

```
make: 'zoohdl.prg' is up to date.

(3) In all the rules really doing something I had to add a 'cd
$(PWD)'command. Without this the Pure C Compiler will complain

Error ZOOHDL.C: Unable to open input file 'zoohdl.c'

I use the following programs:
TOS 3.05
MiNT 0.95 Pl 13
GNU make version 3.62 atariST
tcsh 6.00.02
Pure C Compiler (Version Nov 24 1992)

Any help appreciated,

Klaus

moffatd@dcs.glasgow.ac.uk (Darren Moffat) writes:

>adp@csg.cs.reading.ac.uk (Andrew Pollard) writes:

>>make: Fatal error: Don't know how to make target `objc-parse.y'

>To create a .y file you need to use yacc (Should be on your sun)

Well, the other way around. You need a grammar description in .y
file to feed it to yacc. Actually for gcc you will need a similar
program called bison, if I am not mistaken. gcc grammars use
extra features which will trip yacc. All .y files should be in
a general gcc distribution.

Saying that you likely do not want to have an Objective-C
(cross)-compiler on ST, hence no need to process objc-parse.y,
since there is no run-time support for it on ST of which I would
be aware of. Of course you may want to experiment with the
language and you may think about porting/developing relevant
libraries for Atari computers. In that case an Objective-C
compiler would be handy.

To avoid making compilers you do not want you need to set properly
LANGUAGES in your Makefile. All of this is documented.

Dear netters!

I have a request from my Moscow (Russia) friend. As I'm totally incompetent in what concerns Atary, I'm forwarding his request to you. Help greatly appreciated. Please communicate to him directly, his e-mail address :

avk@global.geogr.msu.su

****

Organization: Faculty of Geography, Moscow State Univ.
From: avk@global.geogr.msu.su (Andrey Kushlin)
Date: Thu, 14 Jan 93 12:13:21 -0500 (EST)
Subject: Software Consultation Needed

[..stuff deleted...]

Please ask them whether they can recommend any communication software for Atari 1040ST that is capable of supporting the UUCP protocol and generating messages with the RFC822 headers (RFC822 is a standard for the Format of ARPA Internet Text Messages, by David H. Crocker).

I do have a standard communications program for my Atari 1040ST, it's called FLASH, but it does not support the UUCP protocol.

If they know anything that meets my demands, please ask them how it can be obtained (free or what's the price).

For this, there's only one way to go: POSIX.1 compatibility. If that
is indeed achieved for the ST, the amount of software running on it
should increase a lot, anyway.

As far as cheap development goes, Linux already offers a POSIX -
compliant environment on reasonably cheap hardware. As an example,
the development of the GNU FORTRAN takes place on a Linux box.

426. Can Spectre parallel output -> serial?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-26 19:58:03 UTC
From: jthomas@kolanut.mitre.org
Message-ID: <1993Jan26.195803.20610@linus.mitre.org>
Source record: 40981

I'm using Spectre GCR to do a lot of Mac word processing, as well as downloading things from my local Internet provider. I rely on the fact that the Spectre software turns the Mac serial printer port output into parallel output on the ST's printer port. Running MultiFinder I can print in the background over the printer port and download at the same time. I want to go to a serial printer (well, it's more complicated than that, but I'll explain later), and I'm wondering if I can keep using the printer port, running the output through a parallel-serial converter.

Has anyone used a parallel to serial adapter on the Atari printer port to drive serial devices?

I know Spectre internally converts the Mac OS's serial output intended for a Mac printer port into parallel output, but is anything done for input? Is this even a reasonable question? (I don't know of any bidirectional parallel devices, although I have seen ads for bidirectional parallel-serial converters.)

The GCR manual doesn't go into a lot of depth as to the nature of Spectre's internal serial-parallel conversion. A one-way (output only) conversion would be sufficient to drive parallel printers, but wouldn't work at all if I tried to hook up a serial device that needed to be able to talk back.

(Actually, my ultimate goal is even more complicated, involving directing Spectre printer output through a null-modem cable into a 486 box running a Unix clone, where a daemon process will handshake like a LaserWriter, accept the PostScript output, and pipe it to GhostScript, a free Gnu Public Licensed PostScript emulator... but that's some time in the future)

Joe

>yields exactly as many bytes as the stat(2) emulation says the file has.
>I didn't found one, and I guess it simply can't be done. So maybe we should
>consider ourselves lucky, after all :-)

It is not going to take much longer until you will indeed be able to.
After all, VMS is going to get a POSIX.1 compliant application interface,
so that stat thing better get fixed or else DEC will have quite a number
of irate customers on their hands ;-)

But then again, even IBM announced POSIX compliance for MVS, and hat
file system is nothing short of a nightmare... that'll be a sight.
End-of-line character, what a strange concept ;-)

>So let's rephrase. The problem is indeed not that UNIX doesn't have a typed
>file system while TOS has; this is rubbish. The problem is really with the
>C language, whose idea of a text file differs from TOS' idea of a text file.
>So in fact, the problem is neither TOS' nor UNIX' problem, but C's problem.

True.

Unfortunately, with POSIX.1 and ANSI-C being the only reasonable
standards for writing both portable and useful programs above a certain
level, you're stuck.

>In C source code, you'll find lots of I/O function calls that explicitly
>or implicitly write or expect a single '\n' as a line delimiter. This is
>not really part of the language proper (which is totally oblivious to
>I/O anyway) but of run-time libraries and/or common usage. This usage
>coincides (not incidentially) with the way text files are usually handled
>on UNIX systems.

You have to distinguish between internal and external representation
here. If you open a file in text mode in C, using fopen(), the \n
character has to be translated to whatever the operating system thinks
is a line delimiter; it might even be the physical end of a record.
For BINARY files, things are different. I'd be tempted to call any
program broken which writes out a \n to a binary stream and expects it
to be treated as line delimiters by anything that follows (at least
broken WRT to the ANSI Standard).

>Okay. So if you write/compile/whatever C programs that produce "text" files
>with '\n' delimited lines, TOS couldn't care less. Those files are perfectly

>legal TOS files. But they violate common TOS usage and are thus no legal
>text files in a TOS environment. So your program has to be considered
>malfunctioning, just like a program that writes files containing ISO-8859/1
>coded 8bit letters.

In a way, that's correct. However, with frequent porting of compressed
files, it might be argued that for reading text files, at least, enough
common usage exists that both \n and \r\n should be recognized when
reading from a text stream. After all, it can't be that hard to
implement in the stdio library.

Since the atari screen is a different size from the Mac plus. Plus it also works with such systems as the Moniterm etc... I think you can safely assume that the Spectre GCR works with overscan. Not 100% sure but it is probable.

430. MiNT & minix filesystem questions...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-27 03:55:36 UTC
From: erics@agora.rain.com
Message-ID: <C1Huwp.7un@agora.rain.com>
Source record: 40985

Hello, all.

I recently started using the minix filesystem driver along with MiNT (how did I get along for so long without it?), and I have a few questions...

First, the version of rz that I've been using truncates filenames to 8.3. Does someone know of a version, in source or binary form, lurking out there which supports longer filenames? Other bonuses would include the ability to run under curses (i.e. in a window under GEM), and the ability to redirect messages to a file (so it can happily run in the background). TOS backward compatibility is not necessary. I've looked at atari.archive and have noted a horde of different programs in the communications directory, but before spending the effort to download them all, I thought I'd consult net.wisdom first.

Second, what tools are available for checking the integrity of and fixing minix partitions, short of buying minix? I'm looking for something with the abilities of chkdisk3 from Atari. Obviously, none of the filesystem checkers I've run across understand inodes and such. If there is nothing out there (PD or commercial), any pointers to cost and availability of minix would be appreciated. I really don't know much about *IX filesystems, but is it naive to hope that fsck for e.g. BSD 4.4 could be made to work on an ST minix partition without major hacking?

Last, and sort of on a divergent point (but anyone who's read this far is likely to have an interest in the answer, or to know it :-), what are the differences between Atari minix and e.g. PClone minix? Are patch files available through the net or otherwise that would allow me to convert my Atari minix x.y.z to PClone minix h.j.k? Would I be able to reuse my purchase without buying a new copy if someone were to take away my ST and force me to use a PClone? :-)

Many thanks in advance.

P.S. Have any other Atari developers noticed the evil path Atari has taken as evidenced by the letter which came with the developer newsletter? Do they honestly hope to encourage new development for the ST? Also, a while back, I specifically requested and got the development information for FSMGDOS. Atari didn't even bother to tell me that it had been abandoned. I first found out through the net. :-(.

Using high speed modems on the ST is not all that hard, if you have the right
software. You need a program caled SERFIX11.LZH (ZIP, ZOO, ARC?) that goes in
your AUTO folder. It will correct a bug that is present in all Atari systems,
with the exception of the TT I believe. Then set your software to use
RTS/CTS and your modem to use the factory default settings. From there things
will work fine. At least, they did with me. I still have trouble doing
uploads at high speed sometimes, but you will not lose text and you will have
no problems downloading (or uploading in most cases).

I hope this helps you out.

The active display can be set by computer sync timing or by the monitor adjustment of vertical and horizontal deflection amplitude. Any IBM monitor has external controls for horizontal and vertical size, the SM124 has internal adjustments. What I am talking about here is the physical size of the picture, not the amount of data displayed as in the overscan mod. The SM 125's that I have seen were all set for larger display but this was one of the improvements. Unfortunately the design was so bad they had a high failure rate (higher than normal for Atari). Anyway as I said in the original post I had already tried the internal adjustments and could not get enough range. I was wondering if there was some other modification required? It doesn't seem so from the replies I have got. Thanks anyway for answering.

436. MiNT distribution kit : congrats

wilsont@rahul.net (Timothy Wilson) writes:

>what does POSIX do for the average joe?

POSIX.1 provides an application interface for programs. It provides highly portable C functions for writing programs across a multitude of platforms, including UNIX versions, but also VAX/VMS (which is about as non- UNIX - like as you can get), for example.

It is modeled on UNIX implementations, so most UNIX code can be ported to POSIX.1 with few changes. Many of the things it defines are those that were traditionally considered "system dependent", such as reading a directory, getting the time, getting information about a file, signal handling, etc - the traditional area of the "system calls".

If you've written a POSIX.1 - compliant application, you've ported it to AT&T SVR4, HP-UX 8.0, AIX, VAX/VMS, Linux, ... without needing to change a single byte in your source code, and without all these pesky #ifdefs.

Finally, the U.S. Federal Government requires that computers sold to it should be POSIX.1 - compliant, so vendors have a VERY strong incentive for implementing that API on their machines.

For those who want to get a feel of what POSIX.1 is like, I suggest browsing through the POSIX Programmer's Guide, one of the O'Reilly books.

Can't remember offhand, but in a review of the Comdex show in the US someone
was showing a 286 board, and said a 486 was on the way. Vortex I think...

The board fits into the processor expansion slot of the Falcon.

Keith!

I think the answer is that you CAN'T do it to an STe... I asked that question only a few days ago. Apparently the circuitry that you need to access is inside a chip on the STe.

Sorry about that!

David.

I thought that you could onlyuse the minix file system with minix? Is this not so, a question to the net suggested that it was no the case.

If this is so, what has a minix file system got over the standard system?

Thanks

Unfortunately NO. There was much discussion last year on GEnie about this.
WordUp does not print with TT's or SST equipped STs. I do not remember anyone
saying whether or not it worked with any of Jim Allens 68030 accelerators.
Dave Small started looking into it, but stopped due to the accident that
nearly killed his child.

My only solution has been to connect my printer to my ST and print there.
It does have the advantage of not tying up the TT while printing.

Sorry for the bad news. I'll send Dave Small a message tonight and try
and find out if he is still working on this problem. Atari, who purchased
the source of WordUp, is not planning on releasing an upgrade. Rumor has
it WordUp is the base of their new word processor.

Only to make it absolutly clear:

MiNT 0.99 is only interesting for those programmers, who already have the new Multi-AES out of the Multi-TOS-packet. When Bob's thoughts will be fullfilled, hopefully, we can get this Multi-AES soon. But till now that's all pure thoughts :-).

From: cjr@cs.bham.ac.uk
Message-ID: <C1ItAG.Ivw@cs.bham.ac.uk>
Source record: 40905

I tried doing a v_opnwk() on MEMORY.SYS (btw, what device number should it have?), and got some curious values in intout[].

Oddest was the device dimensions in pixels: it was monochrome and took ~170K of memory. My "Bitmap Cache" in FontGDOS is 200K, my "Misc Cache" is ~30K. Coincidence? The pixel dimensions were the same as for META.SYS (85um x 85um).

When I set MEMORY.SYS to device 21, the Printer Selector CPX crashes when I click on the name to edit the details (for printers, this changes the page size).

An aside: the META.SYS driver reports it only has 9 GDPs, and then it lists *10* of them in intout[] (cannot remember the indicies at the moment). This appears to be a bug; I haven't checked the old driver yet.

I'm getting curiouser by the minute! Does anyone have the GDOS programming guide mentioned in the FontGDOS docs?

Cheers!

> drives that can be build in ???
>
> Who has any experience? (or opinion)

The basic parts you are looking for are :
1) drive
2) case
3) power supply
4) host adapter

Because you have limited memory I would recommend that you
get TOS 1.4 to avoid using memory on fixes to TOS 1.0.
(Sort of scares me to call 1 meg of memory "limited memory".)

I would get a case that can hold at least 2 drives, and can be used
as a monitor support. The case should also have the 50 pin SCSI
connector, and cabling. This will allow you to move the drives
easily to another platform (i.e., TT, MAC, IBM-clone).

I recommend the ICD Linx host adapter, and ASCI cable. This host
adapter plugs into the SCSI connector and the ASCI cable.

The prices, in US dollars, you can expect to pay for the parts are:
1) drive 40meg $200, 85meg $300
2&3) case/powersupply $50 -> $120 (depends on cabinet and ps rating)
4) host adapter (linx) $100 (should include ASCI cable)

TOS 1.4 $70

I figure you are looking at a retail price of around $400 (US)
for a 40meg harddrive, and around $500 (US) for an 85meg harddrive.

A good source of HDs with cabinets and power supplies are companies
that have older SUN equipment with external HDs. They tend to upgrade
everything, not just the drive mechanisms. I had a 200 meg drive that
lasted 2 years that I purchased, with case and ps, for $150 (US). I just
added a host adapter and was sailing along for under $300. If you do
get a used HD plan to replace the mechanism in a year, and perform lots
of backups. So ask around, the worst answer you'll get is none available.

I have always created my own HD sub-systems. They are easy to put
together and ICDs software is the easiest to use, a copy comes with
every host adapter.

Newsgroups: comp.sys.atari.st.tech
Subject: Calling .PRGs from .PRGs
Summary:
Expires:
Sender:
Followup-To:
Distribution: world
Organization: Dept. of Computing & Electrical Eng., Heriot-Watt University, Scotland
Keywords:

I've been writing a program to time other programs, splitting the results
into program time, Gemdos time, Xbios time, etc. The program uses GEM
and a resource file created with Wercs; a title dialogue is displayed and
once the user has clicked the button or pressed Return, a file selector is
displayed; from here the user can select the program s(he) wants to time.

This works correctly with TOS based programs (I've not tried a .TTP yet because
the program does not have a facility to enter a command line yet) and some GEM
based programs which use, for instance, only alert forms. However, programs
using resource files do not work; they display a 'resource file not found' or
such an error.

What I want to know is 'is it possible to run GEM based programs from a GEM
based program (and especially, ones with resource files)?' I'm not sure if
this can work, because Devpac 2's 'Run Other' menu option seems to have the
same problem.

As a matter of interest, I did try loading Devpac 2 into my timer program since
its resource file is not separate on disk but actually included in the main
program file; it actually worked but could not locate Monst 2 from the disk:
this indicates something to do with the path, but I've tried setting the path
and I've got nowhere.

I hope someone out there can help. Thanks very much in anticipation.

STUART BROWN |Norman Lamont is an anagram of 'Not Normal
2nd Year, Bsc Computer Science |Man' - this explains a lot!
Heriot-Watt University |

459. Schematics for 520?....

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-27 18:05:49 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1993Jan27.110549.4298@arizona.edu>
Source record: 40926

A friend of mine (whose ST has 8 bombs whenever he boots up, as I posted a while back) is looking for schematics of a 520. His is pretty old (TOS 1.0, I think) and has an external floppy. He's an electrical engineer, so he should be able to make sense of things. Does anyone know if and where schematics are available, or does anyone have some they don't want?

Also, we were wondering if it is possible to upgrade RAM and/or ROM in the above machine. If so, what specific boards could/should be used?

That's, of course, not true. Everybody who's able to make it can use it,
also without Multi-AES. I, for one example, do so.

Your problem is probably that you've forgotten to comment out "-DMULTITOS"
in the makefile. :-)

AH! Is THAT why it wouldn't run properly? I got it compiled, and it has kept crashing right after it shows the MiNT is Now TOS message. I changed optimization levels, in hopes that THAT was the problem; could someone give a 5 line description of Multi-AES, why we can't get it, and why I ought to comment out '-DMULTITOS'?

Well it's the Multi-TOS version of AES it's not released, and if you don't
Mint crashes.

463. Re: SM 124 Size adjustment

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-27 21:04:24 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1k6tcoINNdi1@golem.wcc.govt.nz>
Source record: 40906

This message is rather largish, but explains in detail how to adjust your Atari mono' monitor. I tried it, and it worked fine for over 5 months, before I eventually sold if (I have had little use for it lately...)

HOW TO ENLARGE YOUR
SM124
MONOCHROME MONITOR'S
SCREEN SIZE

by
Jack P. Durre'

If you've used the Atari ST computers with the SM124 monochrome monitor, chances are quite good that you have come to accept the wide (black or white) border surrounding the usable area of the screen. You may have asked "why?", but probably only grumbled about it, and went back to work. If you've got the time (about 15 minutes, on average), the tools (3 or 4, and available from most Radio Shack stores), and the nerve (very little required!), this article will explain how you can actually have a LARGER, usable screen (as compared to the Mac)!

First, credit where credit is due...The original information for this modification came from the April, 1986 issue of "ST APPLICATIONS" magazine, in an article written by Albert Lew. I am merely explaining my own methods, following the original steps as outlined in Mr. Lew's article.

That said, let's get the caveats out of the way: While I may personally consider the following modifications to be simple and straightforward, I can't write a "Hello World" program in BASIC!!! In other words, what may be "simple" for me, may be quite difficult for you. If you feel that you are NOT qualified to make these modifications, DON'T! Find an able (and willing!) friend or service technician to do it for you, or forget the whole idea, and live with what you've got! If your monitor is in warranty, opening the case will, obviously, void that, and the possibility also exists that even if you wind up paying for repairs, the technician MAY refuse to work on your machine! (Chances are, however, that he's more likely to want to know more about making the mods himself!) Further, the electrical current coming from the wall plug is enough to knock you silly, or worse, and inside of the monitor case, it gets even stronger, so be aware that touching the wrong thing may well put you into an "endless loop" of your own! In other words, YOU CAN GET KILLED! Now, if

you've decided that you'd "kill to have a larger screen", then follow me!

Tools: These are really few in number, and quite simple to come by. Mr. Lew suggested some non-TV type of tools, but I'm going to stick to my guns here, and insist that you use the right tools for the job! You'll need a Phillips screwdriver, preferably a #1 size. (If you don't know the difference between a Phillips, and a slotted-head screwdriver, let me stop you right here, and suggest that you return to your programming!) You'll also need two TV "tuning tools"; a hex-tool, 3/32" ("across the flats", as they say) and a flat-bladed tool, 1/8" or so in blade width. Both of these tools should be made of non-conductive (plastic) material, and longer is better! A make-up mirror is also quite handy, particularly a free-standing one. I might also suggest a thick towel or other material to protect the face of your monitor and the top of your desk, during the time that you are moving it around. Finally, the toughest item of all...some CLEAR SPACE! You'll need to move the monitor around a little, and of course, it will need to be connected to your CPU (and I DON'T recommend trying to balance it in your lap!), so plan accordingly.

Next, let's try to orient ourselves, so that you aren't amputating the screen, while I am talking about the power cord! The "front" of the monitor is the viewing screen, the "rear" is where the power cord, and CPU/Monitor connector cable exit the case. Since we're going to turn the entire thing around, so that the screen is facing AWAY from us, "right" will now be the side where the speaker is located, and "left" obviously (it IS, isn't it?) will be opposite that, where the control knobs are. "Top" will still be in its usual location, and if you haven't already figured out where the bottom is, it's time for another cup of coffee!!!

Ready? Here we go!

Boot your system, using either the desktop, with one or more windows opened, or call up a text file. The ideal situation is to have text reaching all four corners of the screen, so that you will be able to compare from one area to another.

Now, unplug the monitor's power cord from the socket in the cabinet, and turn the monitor around, so that the rear of the case is facing you. Place the towel or padding on the desktop in front of the monitor, and tip the entire unit up onto the glass face (carefully!). Now, using the Phillips screwdriver, remove the 5 screws holding the cabinet together. (Two on the bottom, one on each side, about 3/4s of the way up, and one just above the power cable socket.) Once these have been removed, put them somewhere safely out of the way, and don't worry about mixing them up, they're all the same size. Now, gently lift straight upwards on the rear sides of the case, and it should begin to lift

away...CAREFUL! You have yet to disconnect the speaker wires, and there's not too much extra wire here. See it? Carefully reach down to the connector where it joins with the mother board, and pull it straight away from the board, disconnecting it. Don't be too concerned about the orientation of the plug, as it will work in either direction. Once you've done this, continue to lift the rear section of the cabinet away, feeding the CPU/Monitor cable through the opening as necessary.

Set the cabinet out of the way (And don't STEP ON IT!), and proceed with the REAL modifications! Tip the monitor back down to its bottom, and arrange the mirror so that you can see the screen while working at the rear of the unit. Re-connect the power cord, and turn on the monitor, being careful to NOT stick your fingers inside the wrong areas!

Grab your plastic flat-blade tool, and start looking along the right side of the mother board (remember now, we're looking from the rear of the set!). Near the front of the board, neatly tucked between the picture tube, or CRT, and a vertical metal heatsink/power board, is a row of 3 white adjustable controls, or potentiometers, about 1/2" in diameter, labelled "VLINE", "VSIZE", and "VHOLD". We're interested in "VSIZE", which is the middle control "pot". (NOW you know why I suggested a long tuning tool!) Gently slip the tool into the slotted head of the pot, and while watching the screen in the mirror (you DID boot up the system, didn't you?), begin to turn the tool slightly (try not to apply much pressure to the pot, as that CAN effect the setting). The top and bottom of the screen will begin to move, together or apart! Expand the screen to within approximately 1/2" - 3/4" of the top and bottom of the "bezel", or plastic frame on the front of the monitor. (Too close to the bezel, and you'll find that you have to be EXACTLY in front of the screen, or miss some of the information!)

See? Feeling more confident already, aren't we?

Moving right along, we will now swap our tuning tools, opting for the hex-shaped one. Looking near the left rear corner of the mother board, close to the point where the power cord socket is located, you will find a plastic shaft with a slot in it, sticking straight up from the board, and just slightly ahead of that, a strange-looking device, composed of a small-diameter tube, with what appears to be a couple of "bobbins" of wire on it. Inside of that small tube, there is a small, somewhat-fragile core of graphite, which WILL break, if mistreated, so act accordingly! Gently lower your hex-tool into this tube, and you will feel it slide home into the core. (Again, don't press down on the core.) By turning this core in a clockwise direction, and watching the mirror, you will see the screen shrink slightly first, and then grow WIDER!!! (Now we're really starting to cook!) Remember to

leave about 1/2" - 3/4" border, to avoid having the edges hidden by the bezel.

What's that you say? Your picture got larger, but it looks off-center? Well, cheer up, bunkie, 'cause we're gonna fix THAT right now!

See that big chunk of glass up front? Well, it has a "neck" on it, and the back end is pointing directly at us, with some strange looking electronic stuff along the way. At the very back of the tube are some electrical connections, but we're not worried about them...what we're after are the two magnets that look sorta like "Q"s around the neck, about 1-2 inches forward of the connections. See 'em? They're dark grey or black, probably, and have a little "ear" sticking up away from the tube, so that you can gently push them around until you get the picture centered on the face of the CRT. Don't worry about touching THEM...just try to keep from resting your hands on any "hot" contacts! This may take a little time to screw up your courage, but once you get the hang of it, you'll find it quite easy! Once you've got the picture fairly well centered, you may need to go back and re-adjust the VSIZE or Horizontal size, as all of these things are interrelated.

Next, we're gonna make the picture sharp again, in case you're worried that you've just lost that beautiful screen that you love so much!

Remember the slotted plastic shaft at the left rear of the mother board? Well, THAT's the "FOCUS" control, and if you'll again resort to the flat-bladed tuning tool, you can use that control to find the best compromise for YOUR taste! Atari chose to go for a tack-sharp center screen, and let the corners be a little softer in focus. You can do the same, or go for sharp corners and let the center go a little soft, or shoot for some compromise. (Hey! Life's a compromise!) Once you've done this step, you can actually turn the set around, and admire your handiwork!

If you see some other minor fine-tuning that you want to go back and do, feel free. This is now a CUSTOM-TUNED monitor of the first rank, and you will have even more pride in your ST than before!

To reassemble the cabinet, turn off the power, slide the CPU/Monitor cable through the rear cabinet section, and with your third hand...yep, gotta remember to reconnect the speaker leads! There IS a sort of indicator as to which way the plug was originally connected...One side has two slots, and the other side has only one, but the speaker WILL work even if this connector is reversed. Incidentally, if you want to go one step further, Mr. Lew suggests the addition of an Audio-OUT connector from this

lead. Your choice.

Finally, having reassembled the cabinet, re-connect the
monitor to the CPU, boot the system up, and check out the BIG
PICTURE!!! If you have any problems, check first, to see that
power is reaching the set, and that the green LED indicator is on.
If not, you may not have reconnected the power cord securely, or
possibly a fuse has blown or been broken (fuses are located on the
vertical power board at the side, near the VSIZE pot, and easily
replaced from Radio Shack).

Enjoy your "new" monitor, and if you have any questions on
this modification, you can reach me here, on CompuServe, at PPN
75046,476.

Seeya! [Jack]

Note: Only use the proper tools for this job, otherwise you can stuff
the monitor, or turn yourself into Kentucky Fried Atari-user!

>Keith.

I must admit that I've never looked into this problem, but can't you
simply detect that GDOS cannot load a font, and tell the user about it?
Something like
"[Cannot use font [blah].|Perhaps insert the font disk?][Retry][Cancel]"
This would even cover removable harddisks.

Also, juggling with disks like this is very difficult. It is very easy
to miss a case where the wrong disk is inserted. Are you sure you
want to do this?

Multi-AES is the new AES by Atari, that supports multitasking and
memory protection under MiNT. We can't get it because it hasn't been
released yet (except perhaps to some beta testers.) You ought to
comment out -DMULTITOS because the standard AES doesn't get along with
MiNT's memory protection, and MiNT's memory protection won't work at
all on a 68000. Commenting out -DMULTITOS produces a 68000-compatible
non-memory-protected version of MiNT that doesn't require the new AES.

Cheers,
entropy

466. What's the scoop on GDOS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-27 23:09:08 UTC
From: lehmann@cs.tamu.edu
Message-ID: <1k74mkINNpqk@tamsun.tamu.edu>
Source record: 40933

Today I went by my US Atari Dealer (who is based in my own town of 40,000 people) and bought a British magazine with two Timeworks Publisher disks. It includes GDOS.

I have seen much discussion about GDOS, but I never used it because I thought it was an expensive alternate windowing system for a very few programs.

So my questions are:

Am I legally supposed to use GDOS? I know that it was included for TimeWorks publisher, but does this mean I can use it for other programs? I don't want to break licensing agreements.

If I need to purchase GDOS, should I wait for Speedo GDOS which has some type of changeable font sizes?

Where do I get fonts for GDOS? Do I buy them from Atari or are they publically available like the fonts for TeX? Or are some fonts free and other copyrighted (requiring a royalty payment)?

Thanks. Forgive my ignorance.

>>in the makefile. :-)

> could
>someone give a 5 line description of Multi-AES, why we can't get it,
>and why I ought to comment out '-DMULTITOS'?

(1) "Multi-AES" refers to the multitasking AES (version 4.0) distributed with MultiTOS
(2) You can't get it because it's copyrighted by Atari and Digital Research, and it hasn't been released yet. When it is released, you may have to pay for it.
(3) You should comment out -DMULTITOS because with it, the default is to try to boot C:\MULTITOS\GEM.SYS, rather than the AES in ROM; and also because -DMULTITOS disables the debugging code.
(4) Finally, if you're on a 68030 machine and wish to run the ROM AES, you'll need to disable memory protection, either by starting MiNT with a "-m" argument, or by recompiling with "no_mem_prot" defaulting to 1.

Hmmm... not 5 lines, but I hope you don't mind :-).

The original Falcon AES is 3.3. This implements 3D objects incorrectly
(using the extended object type, which was supposed to be reserved for
applications). We have fixed that, and the new AES which correctly
implements 3D objects (using bits 9 and 10 of ob_flags) will be put
into production shortly. The AES version number of this AES will be
3.4; the TOS version number is 4.02.

(MultiTOS will also use bits 9 and 10 of ob_flags for 3D effects.)

Alas. I'd prefer for it to be both free, and available now. Of course, being available is MOST important. It's highly annoying when things aren't available at ANY price.

>(3) You should comment out -DMULTITOS because with it, the default is to

I was searching for BOOTGEM.PRG, and wondering why it wasn't called GEM.PRG. I think this explains most of that.

>(4) Finally, if you're on a 68030 machine and wish to run the ROM AES,

No problem. :-).

I took a look at the source, and had figured out SOME of this, once I heard that there was a problem with -DMULTITOS.

With the change, it certainly compiles and runs like a charm. (Well, I had to reboot and kill some stuff that was using memory, because I didn't have enough RAM to get fasttext.c to compile.).

It's running even as I write.

I'm getting more and more impressed.

It hasn't crashed yet, although TOSwin still seems to have some difficulties with sometimes trashing the desktop.

It's even looking like 0.99 is "Warp 9 friendly." I've got Warp 9 running, have done sundry work, logged into the local BBS using Stalker, checked mail using Uniterm in the same session, and nary a bomblet! (For factoid of the day, it's the infamous NCAUG BBS that Eric Rosenquist, author of Stalker has tended to frequent; the BBS has unfortunately moved from the old telephone numbers that are probably in peoples' copies of the STalker manual :-))

Just as a random question: Were things done with MiNT to specifically make it more compatible with Warp 9, or is this just a fortuitous improvement?

My Falcon says "0x0331" for global[0]. I have TOS 4.01 in ROM. I also have a beta 4.02 on disk, but I haven't tried it yet.

> running a GEM program from within a GEM program, to time it.

Leaving aside for a moment the fact that timings of event-driven programs
in a cooperative multitaksing environment aren't likely to be very accurate...

The main thing you need to do is Dsetdrv() and Dsetpath() before the
Pexec(), so that the drive/path of the program you're about to run is the
drive/path of the program itself. That'll let the program find its RSC file.

Be sure to make the screen look more or less like the desktop does: make
sure the mouse is on, and starts out as a BEE shape, make sure your menu
bar (if any) is off. Make sure you aren't holding any wind_update()
semaphors. Do an appl_exit() last thing before the Pexec() call, and
an appl_init() first thing after it returns. Right after the appl_init()
do wind_new() and wind_set(0, WF_NEWDESK, NULL, NULL). I think that's
everything you need to do before and after. (Except shel_write() calls,
which I'm waiting for Atari to bless, more on that later.)

474. Word Processing in Chinese

I have heard that there is a word processor for the atari St that uses the chinese character set.

Does anybody know where to find it or what it is called?

>Are there mouses that don't work with a 1040ST?

I've used a Golden Image GI-600 for over a year now, and compared to
that ugly Atari rodent it is superb. I need about A5-sized area for
it, the buttons are as good as new (unlike in the original mouse, in
which I managed to break the left one!) and I also got it pretty cheaply.

So, I'm pleased with it. Test before you buy.

You must insert the following line in the Emacs startup-file:

```
(global-set-key "\C-h" 'backward-delete-char-untabify)
```

I did this a few days ago, too :-)

On UniX-systems the startup-file is called .emacs, I don't now the
name on the TT (perhaps emacs.rc?). This only works for the Emacs, not
the MicroEmacs.

If you have the full emacs lisp distribution, you can do a
`M-x load-library term/bobcat' or put a (load-library "term/bobcat")
in your emacs.rc file

This file swaps the meanings of BACKSPACE and DEL which ^H and ^?
respectively. Consult lisp/term/bocat.el for details on how it is
done.

Note that you will lose ^H as help key.

Backspace on the ST/TT sends a control-h character, which to Emacs is help mode, so the easiest solution is probably just to re-configure emacs in an initialization file:

(from the emacs FAQ)

* Another approach is to switch keybindings and put help on "C-x h" instead:

```
(global-set-key "\C-h" 'delete-backward-char)
(global-set-key "\C-xh" 'help-command) ; override mark-whole-buffer
```

Other popular key bindings for help are M-? and "C-x ?".

WARNING: Don't try to bind DEL to help-command, because there are many modes that have local bindings of DEL that will interfere.

Almost any SCSI drive will work. Make sure that parity transmission
can be switched off with your drive either by means of a jumper
or at least by some special software.

:
: It looks like I can't get onto the MiNT mailing list (partly coz I don't
: know what the address is, and partly because, well, I'm probably nobody 8)
: ... so I as wondering if someone could give a summary of the interesting
: things since 0.95?

Get mint99s.zoo and have a look at the 'changes' file... ;-)

: -mbaserel and -mpcrel would be interesting to know, along with some info on
: how the shared text/shared data works...

The -mbaserel and -mpcrel options for gcc were implemented by Howard Chu,
and he posted information about them a few weeks ago. Basically
-mpcrel makes the compiler try to use pc-relative addressing mode only
(for text-segment adresses), while -mbaserel makes all accesses to
the data-segment relative to a base-register (currently A4), so that
by just changing that register one text segment can be used for multiple
copies of a process in memory - that means, that if eg. you have a shell
that was compiled with -mbaserel, if you call it 2x (eg. recursively),
MiNT just needs to allocate a new data segment for the second invocation
and can use the same text segment - so that saves you the amount of
memory the second text segment would require. MiNT only has to set
A4 for the second process to the second data segment...
This is supported since Howard Chu's port of GCC 2.3.1 and MiNT 0.96
as far as I know... Shared 'data' doesn't work as far as I know! ;-)

-MY

PS: Howard Chu would surely be able to explain this better... Please
correct me if I'm wrong!

If they do, could they tell me where to get it?

I asked a question the other day, which everyone seemed to misunderstand, so I'll re-state it it a different way, in the hope that someone can help me. I'm using GDOS fonts in a program I'm writing, I'm not trying to hack GDOS, just using them as usual. The problem I have is how to find the fonts when I need them. If people have their fonts on a hard drive, they have no need of a prompt, as the fonts will be directly accessible. However, people without a hard disk will need a prompt to insert the font disk, before I can call vst_load_fonts. I don't want to dictate that the fonts must be on the program disk, as the program already has to access a large amount of data, and space is limited.

Several people suggested I looked in the ASSIGN.SYS file, but I cannot assume that the boot disk will be present, and I have the same problem about finding that as I do with the fonts! The point I was making is that GDOS must load the font path into memory on boot-up, as IT has to find the fonts, so: Is there any way of getting this information back from GDOS?

I can't imagine that I'm the first person to have this problem.

Come on, I'm not being that mean - would you expect a commercial company to give away their secrets? I do often post here to pass on things that I have found out (and am rarely thanked).
Anyway, I'm sure somebody of your programming experience could work out how I have done it (using totally legal programming methods). Consider that I have left the method as an exercise to the reader if you prefer.
If anybody is currently writing a .ACC that could really do with some way of determining the "load" on the computer, let me know and I'll tell you how I did it.
By the way, I will be giving the screen saver away to anybody who registers for any of my CPXs (The number of people registered is currently 1).

Its not quite as simple as that, since many of emacs' modes redefine the backspace function. There is a way to do it, but I don't have the lisp code to hand at the moment. Its in the Emacs FAQ, which is available from one of the emacs newsgroups.

Hey all, I have some questions concerning graphics programming. I will just write my program in GFA as I'm most familiar with that on the ST, but I don't know how to do the more advanced graphics manipulation in it.

How can you draw on a virtual screen then swap screens, draw, etc.. ? I have tried this in the past and it always seems to just bomb and leave it at that. Also, in the manual it has bitblit as a way of moving graphics quickly, but I can't seem to get that command working either.

If anyone has ideas on this, or any other graphics programming (scaling blocks of screen would be nice..) please drop me some mail.. thanks.

Paul..

>
>Any suggestions?
>---

Sounds like the same problem I have. The problem started as you say,
with the disks showing as blank; on mine, the disk-on light would
come on and stay on, but the drive would not run. Eventually though
the screen also crashed. From the moment the machine is turned on, all
I can get on the monitor is a mosaic of pixels, red, green, cyan, you
name it. Can't find any loose connections. I have it boxed up right
now, and I can't decide whether to fix it or junk it.

Speaking of which, the one company in my area that dealt with Ataris
has stopped. Is there a dealer/repair shop in Richmond or Washington
that handles them?

>
Looks like the program is searching it's current directory only for a resource
file. If you can create a "child" environment space, with a new "path" for
the program to search... Lessee... "Flash!" has a nice "GEM" command to run
a GEM program. It also hac a "CD" command to change the directory. I have
not had the gem command fail to execute a program w resource file... but
if I did, I'd do a CD to the directory containing the resource file first,
then try and execute the program.

Other people have told on the net how they moved "all their .rsc files" to
ONE directory... (in your case it'd be the one you run your test program from)
to avoid the problem. You might try moving the .rsc file for one program...
Then go find how to create a "proper" child environment.

PS I don't program, I am just a "user".

Source record: 40842

Hi,

I just read your question about Chinese on the ATARI ST. Yes, there is a word processor called SINOTEXT which was made a few years ago at the University of Bremen, Germany. There are both GB and BIG5 versions.

The input method is great - dynamic full word pinyin. However the formatting capabilities are very poor, for the program was originally designed as an editor for TeX documents.

If you only need a few CHinese characters in your text and have a word processor which is able to handle graphics, you can also type the characters with Sinotext (or some DOS Chinese editor which uses GB coding), save the file and then use the PD program "VPCT" which displays the characters in 24x24 pixels on the screen. Make a screen hardcopy to disk and use the characters as graphics in your word processor. I did this for my M.A. thesis and the result was quite good.

There is another program called SIGNOPRINT which allows you to produce mixed Western/Chinese text with the Signum!2 word processor. But you also need a GB editor like SINOTEXT.

SINOTEXT is available for 250.-- German Marks at the University of Bremen - I can look up the full address for you if you want it.

Other CHinese programs for the ST:

VPCT (View and Print Chinese Text) and
CPREVIEW (Chinese Preview) can display GB coded files on
ATARIs with SM124 monitor. THey are available via anonymous ftp
from ifcss.org or ftp.kth.se (dir: /CJK/atari).

I also made a patched version of VPCT which displays traditional characters instead of simplified.

SIGNOPRINT is available for DM 40.-- from Christian Riedel -
I can look up his address, too.

Then :-) there is CHinDEX, my electronic index to "A Chinese-English Dictionary" for the ST. Get a demo from one of the ftp sites mentioned above!

Yours,
Hartmut

From: mjl-b@minster.york.ac.uk
Message-ID: <728239464.26269@minster.york.ac.uk>
Source record: 40848
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

People might like to know that the latest version of ST Blank, V2.0.1, and its assembler source have been posted to comp.(sources|binaries).a.st and uploaded to atari.archive.umich.edu. I only posted them today, so give the files some time to appear in the various places.

Changes from version 2.0.0 (posted just before Christmas) are:

1) The AUTO folder part doesn't crash if there's no .INF file
2) The dialogues have been tidied up and now look better in medium and low resolution.
3) There's an "about" dialogue as well (purely for aesthetic reasons!)

I'm surprised that noone on usenet has heard of ANSITerm. It is an
excellent terminal program with ANSI and VT-102 emulation. It is one of
the best emulations of VT-102 and ANSI that I have ever seen. I have had
no problems with it on the unix systems which I log onto. If its not
on atari.archive.umich.edu, you should be able to contact the author
at tmiller@suntan.ec.usf.edu The latest version is 1.80, which has
a few bugs, but he is working on fixing them.

```
>> Does anyone have the GDOS programming guide? Where to get it?
> How to find font path, handle fonts-on-floppy, etc.

I have programming docs for GDOS and FSMGDOS. Where-to-get-it is Atari, but
it ain't free. Also, I can tell you now that it doesn't detail any internals
of GDOS, I don't remember any function for finding the font path, and there
isn't enough info to help you go find it in any non-documented way. I also
don't remember any sort of recommendation on how to deal with vst_load_fonts()
when the font path may be a floppy and the disk may need switching.

I'll bet Atari assumed anybody doing work with software complex enough to
use multiple fonts will be using a hard disk. Not an unreasonable assumption,
I say.
```

> new (TOS 4.02) AES uses ob_flags instead of extended object type for 3D

Well thank gawd for that! So many of my applications broke (or appeared so) with the extended object type hack that I was within a hair's breadth of giving up on the ST world altogether.

I'm wondering though: why didn't the use of 3D objects just become a global-to-the-application issue, instead of a per-object issue? I'd much prefer to see a new aes call, maybe appl_3d(TRUE); that informs the aes this application was designed with 3D objects in mind, so use them. It seems to me that mixing flat and 3D objects in one application would be bad style at best.

Also, I'd like to offer some food for thought for those at Atari working on AES internals: please consider setting aside bit 15 of ob_flags and ob_state for use by the application, and document it as such. Even better would be bits 14 and 15, but that may be asking too much. If prior art holds any weight, the GemFast library internals use bit 15 of ob_flags now to define a moveable dialog; the object that can be grabbed to move the dialog has bit 15 of ob_flags set to indicate such. I just couldn't find any other way or place to stuff some indication of what the mover object is. (The reason I'd like bits 14 *and* 15 is that then a rule could be formalized that says 15 is reserved for library implementors, and 14 is reserved for the end application.)

>Am I legally supposed to use GDOS? I know that it was included for
>TimeWorks publisher, but does this mean I can use it for other programs?
>I don't want to break licensing agreements.

You may use the GDOS that comes with the TimeWorks Publisher disk with other programs.

It's mostly a moot point at this time in any case. FONTGDOS (an 'upgrade' to GDOS that came out around the time FSMGDOS was about to be released) has been made available to the Atari community. Only the fonts weren't included in the FONTGDOS release -- and the ones you have from TimeWorks Publisher should work quite nicely for that purpose.

>If I need to purchase GDOS, should I wait for Speedo GDOS which has
>some type of changeable font sizes?

SpeedoGDOS is a new technology, and you will have to purchase the released version ... partly to pay royalties to BitStream for use of their font technology and partly to pay royalties for BitStream font families. Current rumor is that SpeedoGDOS will be packaged with the Falcon computer.

The primary difference between GDOS and FSMGDOS/SpeedoGDOS is 'scalable fonts'. You don't need a physical font file for each font size of a font family. GDOS has some rather crude font scaling -- if you have a 12 point font you also have a 24 point font available --- but it is not a smooth scaling, and can be extremely disappointing at print time. Truly scalable fonts look good at any reasonable font size.

>Where do I get fonts for GDOS? Do I buy them from Atari or are they
>publically available like the fonts for TeX? Or are some fonts free and
>other copyrighted (requiring a royalty payment)?

GDOS fonts can be purchased, you can get fonts through the on-line services, and you can also check out the atari.archive server. Several GDOS fonts are available in the Applications/Dtp/Fonts/Gdos directory.

A freely available GDOS clone from Germany is also available. Look for the file amcgdos.arc on the a.a. server.

FONTGDOS is available on GEnie. It is also in the Printing directory on the a.a. server. It consists of a number of printer .SYS files, some desk accessories, the fontgdos.prg and a text file. There are no fonts in the archive.

>Craig
><craig.dunn@almac.co.uk>

The Falcon does have a socket which it was orginally said was for a 386SX.
This could in theory run at either 16 or 32MHz without too much hardware.
Since the socket only provides a 16 bit data bus you won't be able to use
an intel 486, but I believe Cyrix make 486s especially designed as plug in
upgrades to 386SXs.
I don't know how much hardware (in addition to the actual CPU) would be
required for such an upgrade, so I don't know how much they would cost. ST
Format once claimed that you be able to literally just plug a 386SX straight
into the socket, but this is almost certainly wrong.
Since both processors would be sharing the same bus, you wouldn't want them
running at the same time (unless the 386SX had a large cache), and it could be
difficult to stop one of them without wires trailing around the motherboard.
I'm not an expert, which is why I didn't reply to you earlier, so sorry if I
have got anything wrong.

>Timothy Wilson <wilsont@rahul.net>

POSIX.1 is a source level standard interface for programs.. ie if you write
a C program using only calls to POSIX functions in a POSIX standard way then
the program will compile and work on any POSIX standard system (in theory
:-)).

The main problems with the POSIX standard are:-

(1) In some areas it contradicts the ANSI C standard.
(2) It is highly minimalist.

Well there you are.

OK, try looking for \assign.sys on _bootdev. If it isn't there, stick up an alert "Please insert the boot disk", and loop around 'til you get the file. The get the PATH info out of the file. Then look for the directory mentioned in the PATH (alert if not found, etc). When all is Ok, do a vst_load_fonts().

504. MegaSTe hard drive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-29 12:55:58 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1206@usdtsg.DaytonOH.NCR.COM>
Source record: 40858

I have a question regarding the MegaSTe and hard disks (forgive me
if this is in the FAQ - I'm not sure)...

Anyways, I have a MegaSTe/4 with NO internal hard drive (just a
Megafile 30 sitting near it). If I wanted to put an internal hard
drive in, what pieces of hardware would I need? (host adapter, etc?).
Would it be simpler to get one installed internally (saving me the
problem of having to get a box to put it in, etc) or just getting
an external one and ICDLinking it? Personally, I'd like it internal.
The company I bought it from (the computer) would probably be the
one to do the installing (as I am not a hardware-hacker by any means),
so there would be someone with technical-sense doing it...

Any help or comments (no flames, though since it's been so cold outside
a few flames wouldn't be all bad :-) would be appreciated. Thanks...

POSIX is a rough acronym for "Portable Operating System Interface based on
UniX". The whole effort was kicked off by the US military, which was fed up
of a proliferation of different OSes.

>POSIX.1 provides an application interface for programs. It provides
>highly portable C functions for writing programs across a multitude
>of platforms, including UNIX versions, but also VAX/VMS (which is about
>as non- UNIX - like as you can get), for example.

>AT&T SVR4, HP-UX 8.0, AIX, VAX/VMS, Linux, ... without needing to change a
>single byte in your source code, and without all these pesky #ifdefs.

You hope! POSIX support is a bit flakey at the moment, and parts of the
standard haven't settled down yet (signal handling, threads etc.)

It is interesting to note that MiNT has a lot of POSIX-like stuff. For
example, the signal handling is like that proposed for POSIX, directory
handling is POSIX compliant etc. etc.

What I also like about MiNT is that it borrows some ideas from Plan 9, the
"successor" to Unix. This includes the "everything is a file" idea.

507. Closing Windows and WM_NEWTOP

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-29 14:23:38 UTC
From: hrs@aber.ac.uk
Message-ID: <1993Jan29.142338.10593@aber.ac.uk>
Source record: 40862

This question may have been answered before but if one has more than
two windows open at once (say three) and the user closes one of them, does
GEM send a WM_NEWTOP message to the application telling it which of the
remaining two is now active? In the program I'm writing, when I close
a window I don't get a WM_NEWTOP message and I've no way of knowing which
of the remaining windows is now the active one. When does WM_NEWTOP actually
get issued? I receive WM_TOPPED when I click on an inactive window so that
message seems to work. I realise that when a window is closed, a redraw
mesage is send to the new active window, I guess I could intercept the
redraw to find out the new active window.

>

Paul, I could try to dig up some example source code for you that uses XBIOS(5)
to swap between physical and logical screens but that may be a bit tedious.

Paul, I don't mean to make this a "commercial" post but I suggest you purchase
a copy of "The GFA BASIC Toolkit, Vol 1" from Taylor Ridge Books, 203-643-9673,
for $34.95. It has a lot of custom graphics routines (including page flipping)
which you can merge into your own programs. The routines are all documented
and intended for the beginning to intermediate programmer.

While I compiled the book, edited/commented the routines and wrote the demo
programs, all the routines are pd and you are free to use them as you wish.
If you don't want to pay for the book, you could probably find similar
routines in the GEnie libraries if you cared to search for them. Again, I
apologize to all if this sounds like a commercial post but it really _is_ the
best source for graphics routines (and others) for beginners, IMHO.

Also on GEnie is "GFA-EXPERT" by Han Kempen of The Netherlands which is really
an excellent second GFA manual. It's PD and is for the intermediate level GFA
programmer and is a must download. Sorry, I don't know if it is available on atari.archive
or not. I believe there are a few new GFA tutorials/utilities
on GEnie that I may not have checked out yet. And if you need info on how
to access GEnie, just ask and I'll email you the info.

511. HSC 1.40 now available at a.a

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-29 18:55:38 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Jan29.185538.20117@mnemosyne.cs.du.edu>
Source record: 40866

Heat-and-Serve C version 1.40 is now available at a.a as HSC140.LZH. As
with v1.33i, it includes an automatic installation and configuration program.
I've been receiving email questions about what was fixed and what's new in
v1.40, so I figured I'd better post a little summary for y'all.

- Support for ARGV command lines in all compiler pieces. Allows sensible
makefiles, removes limits on how many names can be passed to CC at once.

- All compiler pieces that used to occasionally do a Cconout('\0') to
allow DOS to sense a ^C now do that only under plain TOS. Under
MiNT that didn't work well (they tell me), so under MiNT it does a Yield().

- Bugfixes and enhancements in HCC. Major points include:
- Handling of -I command line option fixed.
- You can now index into arrays larger than 64k properly.
(But size_t is still short.)
- Preprocessor now supports #elif.
- Embedded assembler now easier, via #pragma asm statement.
- Lots of other minor things.

- Changes to JAS:
- JAS now understands regs CCR, SR, USP, and instructions that use them.
- PC-relative addressing now works on all instructions.

- Changes to TOP:
- Vast speedup. No, I mean really vast. (It used to take over 800
seconds to optimize one of top's modules. Now it takes 127 seconds.
YMMV, but it's faster on most anything you throw at it.)
- Added a few new optimizations, based on new 'hints' emitted by HCC.
- Fixed some broken optimizations, such as incorrectly generating an
nnn(An, Dn) addressing mode where nnn was not in 8-bit range.
- Now handles modules which include a bit of embedded asm code.

- Fixes and enhancements to LD:
- Old compiled-in limits on the number of object modules, etc, have
been increased. Also, new command line options are available to
increase (or decrease I guess) these limits if the new compiled-in
defaults aren't enough. Now you're only limited by available memory.
- LD automatically sets the FASTLOAD bit in the program header now.
(Funny how things like that become an issue when you suddenly get a
machine that has 14mb!)

- Changes to MAKE:
- It can now pass up to 255 args on a command line when it invokes a
program. (Yeah, there's shouldn't be any limit. I'm looking into it.)
- Lots of new builtin commands:

del delete rm remove unlink cp copy set setenv chdir mkdir rmdir
pushdir popdir echo beep pause
This lets you write cleaner-looking makefiles using the idiom of your
favorite shell (unix, msdos, etc).

- Changes to runtime library:
- Finally applied Mark Ramaer's malloc() fix.
- Fixed access() to standard unix-type return values.
- Fixed memcpy/lmemcpy.
- Added atexit() function and handling.
- Added _InitLibs(), _InitArgs(), _InitStreams(),
_InitClock(); mostly for internal use only.
- Changes in dstart.s to support atexit, _InitLibs, etc.
- Added exterrset() exterror(), perrorf(), vperrorf().
- Tweaked text of messages from strerror(). They are now
very non-specific and generally useful. (EG, -35 reports
"No more handles", without specific reference to file
handles: also useful for reporting lack of VDI handles.)
- Added spawn(), spawnv(), spawnve(), etc, etc.
- Added handling of ARGV arg passing standard. Programs
can get args now from ARGV, xArg, or command line (it
checks them in that order.) The spawn() family will
pass parms via ARGV. (The fork() family doesn't; yet.)
- Added usleep().
- Added exists().
- Tweaked operation of findfile(), pfindfile(); the latter
now searches the current directory before going and
looking in path places. (The former is just faster now.)

In general, everything that was reported to me as broken in v1.33i has
been fixed (however clumsily) in v1.40. That doesn't mean 1.40 is bug-free,
but I think it is more robust than 1.33i.

By far the most effort in the 1.40 release is the changes to GemFast.
Those are too numerous to detail here, I'll post a summary separately.

The HSC140.LZH file is almost 500k. Uuencoding makes it way bigger than
that even, so I'm sorry to say that I CAN'T honor requests to send a copy
via email. On the other hand, the file is now available at a.a and the
mirrors of a.a, so you should be able to ftp it or request it via a mail
server without any problems. You will need a version of LHARC that can
handle -lh5 decompression to unpack the archive.

I'm using v2.01h of Quester's lharc. What is the latest version?

2.01h doesn't handle the 'f' (freshen) command properly when the archive contains subdirs, and that screws me up something awful. (Properly == how the msdos version does it: if the archive contains subdirs, lharc goes and looks in all the subdirs for things to freshen.) Does the latest version handle freshen properly?

If it is an old computer, you will probably have good luck by putting in new sockets for the ROMS and the GLUE and MMU. As the computer gets older, the sockets deform from the heat generated over the years. I put in MILSPECS myself.

>Ok, do a vst_load_fonts().

I'm fairly certain there is a GDOS-compatible product that lets you
have different SYS files that will not necessarily be called
assign.sys.

I suspect your scheme will lose when running this product.

Maybe a file selector is in order.

Cheers,
entropy

p.s. this may not have any relevance to reality--I don't use GDOS or
any GDOS-type programs myself, all information herein is hearsay.

>flat and 3D objects in one application would be bad style at best.

Not at all. There are many cases where one might want to mix 3D objects with 2D ones. Remember that strings and icons are objects, and you might want (for example) to put a 2D icon inside a 3D box, in order to get a sort of "hilight" for the icon. Making the 3D/not3D selection per-object gives programmers much more control over their resources.

> Also, I'd like to offer some food for thought for those at Atari working on
>AES internals: please consider setting aside bit 15 of ob_flags and ob_state
>for use by the application, and document it as such.

We could consider doing this, if there is enough demand and a demonstrated need. But remember that every time we do something like that, we limit our options in the future. If we run out of bits, then we'll end up with something like the extended object type fiasco...

> If prior art holds any
>weight, the GemFast library internals use bit 15 of ob_flags now to define
>a moveable dialog; the object that can be grabbed to move the dialog has
>bit 15 of ob_flags set to indicate such.

DON'T DO THAT!!! I said we *might* be able to set aside bits for the user; but we might not, and for now the documentation (both DRI's and Atari's) certainly says that all bits in ob_flags and ob_state are reserved for the operating system, and unused bits must be set to 0.

There are 8 bits in the extended object type field. DRI's documentation said that those are for application use, and we've formally endorsed that. Use those for any application or library specific stuff. It's particularly important that libraries should follow the rules, because if they don't then programmers who really do mean to do everything legally can suddenly find themselves with non-conforming programs because the library did something illegal without their knowledge.

Regards,
Eric

516. A couple of programming questions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-30 01:54:27 UTC
From: elvis@watserv.ucr.edu
Message-ID: <25604@galaxy.ucr.edu>
Source record: 40872

Hi,
I've been trying to fix a couple of bugs that have been reported to me about expand-o-matic, but have been having difficulty because they are with different TOS versions. So... I was wondering if some of you could offer advice.
The first problem is with the information that TOS 2.05 + passes through filenames with drag-and-drop loading. I had assumed that argc would contain the number of filenames (well number + 1), and argv[1 to argc] would contain the names themselves, which is how NeoDesk does it. I got mail from someone, however, saying that under TOS 2.05 it only did the first file and then skipped the rest. As I only have TOS 1.04, and do drag-and-drop via NeoDesk, I have no way of experimenting to find out how 2.05 and up actually do it. So, to put it simply, how do TOS versions 2.05 + pass in the filenames?
The second problem is a bit more vague, and I doubt if anyone can give me a specific answer, but maybe someone can point me in the right direction. I have been trying to track down a problem that causes expando to bomb on this one person's machine, but only when they are using TOS 1.0, 4 megs of memory and a color monitor. If they change any of that, TOS 1.04 or 1 meg or mono monitor instead, it works fine. My personal setup is TOS 1.04, 2.5 megs and a multi-sync monitor and I have been unable to re-create the problem. The person has run a number of tests and it is only with that exact configuration that he has the problem. It bombs sometime between the end of the Pexec() to run the archiver and the clearing of the screen. I'm going to try sending him a copy of the program that has some debugging messages to try and find out exactly where it is dying. Anyway, I realize this is all a bit vague, but as I was going to ask the other question I thought I might as well throw this one in as well... can anyone think of what might be peculiar to the above setup to cause this? I believe that he is running the same auto programs in all cases, and he has run a memory check, and I am very baffled.

Thanks in advance for any help,
Andrew Cullum (elvis@watserv.ucr.edu)

517. File transfer question

Newsgroup: comp.sys.atari.st.tech

Source record: 40871

I have recently bought an Atari 1040 ST, and I would like to replace my old volker-craig terminal with this new piece of equipment. I found a terminal emulator on one of the major archive sites and downloaded it to my UNIX workstation. But now I am stuck. The manual says that in order to get started, I must have the two pertinent files on a floppy disc; I have no idea how to transfer files from a SUN SPARCSTATION 2 to an Atari-readable floppy. Our equipment here is such that there is no problem in transfering the files to Macintosh floppys; and transfering to PC floppys is possible with a little work.

So, can anyone help an absolute beginner?

> DON'T DO THAT!
```

Well, rest assured, I'm desparately brainstorming on a way to undo it. You've got to understand that at the time I decided to use that bit, I asked myself: Is Atari going to ever use this bit? Then I answered myself with another question: Is Atari ever going to ehance the AES in any way, it has been 7 years since any significant changes were made.

I figure at the rate Atari is moving (not even considering the backwards movement that seems to be present in some 'enhancements') I figure I'll have the bit 15 usage worked out some other way long before Atari gets around to using that bit.

> Flash has a GEM command

Which sets the current drive/path to the drive/path of the program about to be started, that's why such programs always find their resource files.

Perhaps the simplest solution is to set up an environment variable, PATH=, and in it list the paths where all your programs (and their RSC files) are.

There's only one drawback to that idea... AFTER OVER 7 YEARS AND HALF A DOZEN TOS UPGRADES, THE DESKTOP STILL DOESN'T SUPPORT ENV VARS! It's things like that which make me despair for Atari's ongoing presence (such as it is) in the marketplace.

But, if you have my HSC compiler package, you have env var support via the GEMENV program included in the package. Of course, if you have a Falcon you'll find that GEMENV doesn't work as well on it, because Atari gratuitously changed the way the desktop handles its environment. I say gratuitously, because while the internals of it changed, the desktop still doesn't support env vars. (IE, so what was the purpose of the change?)

Really, with basic TOS totally stagnated, and MultiTOS going the direction of unix (nice for programmers, useless for end users, and most of your existing aps won't work right with it), I really sometimes wonder what I'm doing still messing with these machines.

> when is WM_NEWTOP sent?

Never. Its inclusion in the documentation is an error, there is no such message. Or so Atari tech support has told me. This applies under regular TOS, under MultiTOS totally different rules apply.

Also per Atari support: the only reliable way to stay informed as to the top window is to make a wind_get(0, WF_TOP,...) call periodically. Luckily, they say this is a fast call, as such things go, and doesn't hurt performance.

"successor"?!?!? This "everything is a file" idea goes BACK to
Multics, which preceded UNIX (if not before that in some lesser known system).

I always find it surprizing how many things in computing people think are
"new" that have been around for decades, or go back even before the
digital computer. (although they were often in systems that never got much
further than the lab, often because the companies had no idea what to do
with them then).

Atari sells a hard drive kit for the TT and Mega STE that includes everything you need to install a hard drive in your computer. I think the host adapter is already in your computer; you could probably open up the bay and take a look for yourself. In any case, the kit has everything you need. (I hope Atari is still selling these.)

Talk to your dealer. If he knows nothing about it or gives you the run-around, find another dealer. If you don't know of one, leave me e-mail and I'll recommend a few.

Oh, BTW, Atari's kit doesn't include the hard drive mechanism itself. Your dealer could find one for you though. I'd recommend a Quantum drive.

Also, ICD is on the verge of releasing their SCSI Professional utilities which don't require an ICD host adapter in the system to use them. You might want to check into this package as well. I prefer not to use Atari's hard drive utilities because ICD's have more features. You can order the package now, and you'll receive everything but the manual, which isn't finished yet. The package is $50 and I've heard that it includes CleanUp.

526. I need help with rsrc_load in Basic

Newsgroup: comp.sys.atari.st.tech
Date: 1993-01-31 04:09:38 UTC
From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Jan30.220938.691@rivers>
Source record: 40881

Help!

I've been trying to design a program which uses .RSC files, and
I can't get rsrc_load to work. I'm using a compiled BASIC same in dialect
to ST-BASIC on the language disk. I pass the pointer to the filename, call
the AES function rsrc_load, and my STe keeps asking me to put disk A: in the
drive. I'm running my program from my ram-disk G:, and I've tried including
full path names and the .RSC extension into the filename. Nothing works.
What should I do?

If you can copy the files to low density (720k) PC floppies, your ST should be able to read them perfectly. STs and PCs use very similar disk formats. Hope this helps.

M Ali

IL> (Except shel_write() calls, which I'm waiting for Atari to bless,
IL> more on that later.)

You should watch out with that wind_new()-call. That call has only been present since TOS 1.4. I suppose you use it to clean up any windows the GEM-application may have left open, so it's not really necessary, just a safety precaution. As long as it doesn't bomb TOS 1.0 and 1.2 machines this is OK, but I'd check this out if I were you.

From: kstearns@cs.ulowell.edu
Message-ID: <C1q3BF.DsM@ulowell.ulowell.edu>
Source record: 40885

I have an Atari 1040 ST-F with both internal and external floppy drives.

For the first hour after power up, nothing happens...monitor is black

and the drives remain inactive. Then the drive lights go on and the drives

start to spin slowly. After a half hour to an hour the comes on to a white

screen. At this time after hitting the reset button the computer works

normaly. The problem has been definately isolated to be in the power supply.

Without purchacing a new power supply can this be fixed? and how?

If not, is anybody selling a used or reconditioned powed supply?

Any help will be appreciated.

The "new" thing about Plan 9 is that it treats CPUs as "files" (of a
sort).

Actually the "everything is a file" idea is something that goes back
(within the Atari line) to the old Atari 800. It's not even new to
Atari! On the 800, you could do almost anything other than
computations (i.e. - assignment of variables), pokes, and
Player/Missile graphics using the XIO command. The tape drive was a
"file". Likewise for disk drives. And graphics screens. And
something called the "editor device" (E:).

It's one of the things that set the Atari 8 bit machines apart from
the other home computers at the time.

Or use the Mac, if that's easier. Most Mac's have a "superdrive" that can read
and write regular DOS-disks -- which can also be read by the ST...

When I openned my 1040STF recently to clean my FDD, I noticed an area under 2 resistors next to the transformer (in the power supply board) that was black, obviously from getting too hot. When I examined the bottom of the board, I noticed that the solder joints on one of the resistors looked like it was comming loose in addition to the circuit trace. I resoldered these resistors and also added a jumper wire on the trace that was comming loose just to be safe. Perhaps you'r problem is a loose solder joint here?

> using .RSC file from Basic

It may be that you need to use some command, option, or keyword in your Basic program (or on the compiler command line) to leave some memory free. The AES has to allocate memory to load the .RSC file, and some Basics will take all of memory for the program, leaving none for the AES.

535. Driver for a Wang Daisy wheel printer!

Hi, I am posting this on behalf of a friend as I can't seem to get hold of a driver for him:

****
I'm looking for a driver for an old (1984) Wang daisy wheel printer. I have a 520 STFM with an early TOS so I can't use first word plus.
There are two serial numbers so here they are:
1) 87057580
2) Wang serial number PO 3949
and the model is a 620.
****

Thanks
Mike

PS Please Email me!!!

536. Turbo 25 Accelerator __FOR SALE__

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For Sale:

T25 in EXCELLENT condition.

Reason for selling, it doesn't seem to want to work in MY Mega ST4. It works in all other types of machines and has been tested in 3 1040's, 2 Megas, and a 520 with all versions of TOS from 1.0 to 2.06.

Selling Price $250 which includes shipping.

Leave e-mail if interested.

Source record: 40792

```
>> Can anyone tell me how to read in the BIOS boot sector paramter from a
>floppy
>> disk and how to access the value of it in C? I am having loads of trouble,
>> getting spurious data, or hang-ups!
>
>In Pure C/Turbo C, you just say:
>
>#include <tos.h>
>
>[...]
>
> BPB mybpb, *bpbptr = Getbpb(drive);
> if (bpbptr)
> {
> memcpy(&mybpb, mybpbptr, sizeof(BPB);
> /* read the values in mybpb */
> }
```

Please be _VERY_VERY_CAREFUL_ when using Getbpb() - if the disk (floppy or removable harddisk) was changed /after/ the last GEMDOS access to that drive, Getbpb() will clear the corresponding BIOS media change flag, so GEMDOS will never know that the medium was changed.
This can cause /very/ serious trouble, including, but not limited to a destroyed FAT!

The easiest solution: just do something like:

```
{
static char name[5] = "#:\\x" ;
int handle ;
name[0] = drive + 'A' ; /* <=== this may not be correct under MiNT!! */
if ( (handle=(int)Fopen(name,0))>0 )
Fclose(handle) ;
}
```

immediately before the Getbpb; this will cause GEMDOS to check the media change state before the Getbpb() destroys it.

From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Jan31.213912.695@rivers>
Source record: 40793

SORRY!!!

I just found out I was using the wrong pointer to my file-name.

Whatta dumb mistake...

But I have another question to anyone familiar with AES objects...
What exactly does the RADIO_BUTTON attribute do? It seems to keep me
from selecting two radio buttons at the same time, but what if I
have more than one set of exclusive buttons? (like on the desktop Preferences..
item) how do I define those objects?

Any help will be gratefully appreciated. Thanks!

BTW: (to Ian Lapore;)
I found out that I had just enough memory left over to load my small
resource, and to load bigger ones I would have to give up more memory
to TOS. Luckily this is easily implemented in my program using one DEF
statement. I might have overlooked this without your input;
Thanks Ian. :)

Larry I.

Oh dammit, why do all my ideas get crunched?

I thought the upper ob_flags and ob_state bits were "user-defined" not
"reserved". I'm using 14 & 15 of ob_flags in my GEM++ library. Oops.

You will find no problems using high-density disks with your TOS 1.4
Atari.
!! IF YOU HAVE INSTALLED A HIGH-DENSITY DRIVE, that is. !!
There are two very good, but cheap, commercial programs around that will
enable you to format high-density disks in you ST: Harlekin 3 (Try Hi-Soft
in the UK), and Fast Copy Professional (The ST Club in Nottingham). I use
both of these programs extensively and they have not given me any trouble
formating HD-disks.

> anyone have experience with them or other removeable-media drives?

I own a Generation Systems 88 MB SyQuest hard drive which I use together
with both my Macintosh LC (sorry folks, I have to), and my TT/030. Of
course I have different cartridges but I do carry them along quite often. I
even carry the drive itself between home (TT) and work (Mac). I have
nothing to complain about whereas reliability is concerned. And talking
about speed, the SyQuest is much faster than the internal Quantum drive in
my TT, and moreover, the SyQuest drive is in fact lightning fast on the TT
compared to on the Mac.

Of course you will have to get some kind of SCSI host adapter or go for a
SyQuest drive dedicated to the ST.

!! GO FOR THE SYQUEST !!

Yep! It is called G+PLUS. The G+ manual shows how you can detect if G+ is running, and not GDOS. It returns a pointer to an internal G+ structure, which includes the assign.sys filename if I'm not too mistaken.

545. THE PC- FALCON DEBATE.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-01 09:45:00 UTC
From: craig.dunn@almac.co.uk
Message-ID: <1541.724.uupcb@almac.co.uk>
Source record: 40800

This is NOT a flame! It's just an extract from a letter in a magazine talking about micros. So I don't wan't people mouthing off about how good their new 586 is.(That is NOT a home micro!) I did not write it. I am mearly passing it on to everyone who's been putting the Falcon down. And I repeat what I said in an earlier piece, "Every computer has it's place, it's good points and it's bad points. A PC is great in the business world with a huge following technically but is a bit pricey from home use. A Falcon is a great home micro which has many uses but will never make an impression in the business market. An Amiga is also a great home computer with good graphics and a large games base but hasn't a hope of making it in the business world. That's the facts. And whomever disagrees is living in a world tinted by their own computers brand names."

"I noticed an advert in your magazine for one of your numerous sister magazines. The interesting part of the advert was not the main content, but the small print at the bottom claiming that a 25MHz clocked 80386SX based PC is faster than the new Falcon.
<text skipped>
Obviously a 25MHz processor, to the uninitiated, will appear faster than a 16MHz processor, but in the quoted case, this is blatantly untrue. The 68030 is a full 32-bit processor with an onboard instruction cache. The 80386SX is a 32-bit processor internally, but with only a 16-bit data bus externally. Thus it takes the 386SX two instruction cycles to access 32 bits of memory, where the 68030 takes just one. Add to this the fact that most 32-bit fetches are for the instructions themselves and it becomes clear that clock speed does not equal processor speed. Far from it, since most CISC processors such as the two above take, on average, several clock cycles to execute a particular instruction and this average cycles-per-instruction ratio varies widely between different processors.
Having said that, there is the general claim that the PC listed is faster than the Falcon. The Falcon will be a state-of-the-art machine and you need a very fast PC to equal its processing power. Processor speed is measured in MIPS (for measuring the execution speed) and in Whetstones (for measuring the mathematics speed) and not in MHz as used by the people at PC <name witheld> and several other PC magazines, though measurement by MHz is useful for comparing different PC compatibles.
To build a PC equal to the Falcon you would need at least a 80386DX based PC, clocked at 33MHz - the high clock speed being needed to compensate for the speed loss because of DOS and the BIOS. You would also need a fast VGA video card (since the cards fitted as standard by most suppliers are inadequate for playing graphically intensive

games), say one of the ORCHID range, a multi-channel sound card and as much memory as you can afford. The cost of such a setup would be in the region of 1,500, for which yo could have a Falcon plus lots of extras.
But I was forgetting, the Falcon also contains a DSP 56001. This chip is not just for handling sound and pictures, but is also a lightning fast processor which easily outperforms even a 32MHz 80486 because it can perform operations in parallel and with phenomenal efficiency. So maybe those PC owners who want the sheer processing power of a Falcon had better wait for the 80586 50MHz to come out......"
<name> Electrical Engineer.

The letter does not end there..but this is the part I wanted to let you all read.. Can anyone disprove what is said in this letter? If so, write the fact and then underneath the disproof. I repeat I'm not flaming. I just want the facts, whatever side of the line they lie on, as I use a PC at work and will be using a Falcon at home (soon).

Cheers all.
Craig <craig.dunn@almac.co.uk>

546. MEGA-ST4 broken down - any info?

Hi out there,

My MegaST4 gave it up. Fuse defect.
I inserted a new one, but soon as I switched the power, it blowed up again.

I connected another power supply, but on power up the system idled in making
the monitor black and white every second and giving up ping sound.

Did anyone have further information, would could be distroyed and how expensive
the repair could be???

My setup: MEGA-ST4, 105 SCSI QuantumPro, HP_DJ 500, Zyxel - all connected to one
PowerSwitch!

Thanks in advance

I am considering a very suped-up 520st vs. a stock 1040st. The question I have concerns the "multitasking" capabilites of the machines. I plan to use the machine with a very low-use file server program running in the background at all times. Is this even possible (ie, does the ST offer true multitasking) and would the ST still be relatively useable? The file server application would probably just spend most of its time waiting, but would even this bog the machine too much?

Commerical companies and software secrets is a real can of worms, and I'm not going to open it on comp.sys.atari.st.tech! Suffice it to say that if every company that discovered a good way of doing something patended it (the commercial way to stop others using your idea), software development would grind to a halt!

The XOR method of placing a mouse cursor on a bitmapped screen is patented. Imagine what would happen if the "blit area under cursor before and restore afterwards" method was patented -- then we'd all be screwed!

> Anyway, I'm sure somebody of your programming experience could work out how
>I have done it (using totally legal programming methods). Consider that I
>have left the method as an exercise to the reader if you prefer.

This is hardly the point! I'm disgusted that you want to keep a technique secret "so that everyone will use my program." That's my real objection.

> If anybody is currently writing a .ACC that could really do with some way
>of determining the "load" on the computer, let me know and I'll tell you how I

This information is available under MiNT, of course -- but under ordinary
GEM? What do you mean by "load"? Under Unix (SysV Unix, that is) it means the
number of processes that are in the "runnable" queue. Using that
measurement, you always get "1" for ordinary TOS.

>
>"successor"?!?!? This "everything is a file" idea goes BACK to
>Multics, which preceded UNIX (if not before that in some lesser known system).

I didn't say that the "everything is a file" idea was new!

I said "successor" (note inverted commas) since Plan 9 is only a "successor"
in the sense that the Plan 9 team includes most of the original Unix team
(Pike et al) and it uses Unix file system ideas. Of course, many ideas for
Unix came from Multics (and indeed the name Unix is said to be a parody of
Multics).

However, the Plan 9 project has done much to popularise the "everything is a
file" concept -- more so than Multics.

I know where the Unix and Plan 9 ideas come from, but I didn't think
comp.sys.atari.st.tech was the place to burble on about them. However, you
force me to clear the matter up!

Having in the past managed to connect my colour monitor from a dead Amstrad CPC 6128 to my ST (mail me if you want to know how) I decided that I would like to switch between this and my new(ish) SM144. Is the only wire I have to switch the mono detect one (assuming I only have one monitor plugged in (& turned on) at one time)? I'd like to hear from anyone who has done something similar.

I know
where to get the componnets in the UK - if you'd like to find out. I've also connected an AMX (Logitech) mouse for the Amst. CPC to the ST, CPC 2nd 3.5" disk to the ST and taken the internal disk drive from one CPC and made it into a 2nd drive for another.

554. Interrupt problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-01 13:30:48 UTC
From: mmartin@neumann.une.edu.au
Message-ID: <mmartin.728573448@neumann.une.edu.au>
Source record: 40809

I am having problems implementing a sample playback function in
a program I am writing on an ST. The function is written in assembler
and is linked to a GEM program using Pure C. When the function exits the
program can get quite unstable; there are repeated window restore
messages, the cursor in the file selector box flashes and if I quit the
program the directory window is continuously updated. It looks like
it's working off interrupt messages accumulated during the playback
function where they are turned off using xbios to get into supervisor
mode.
The interrupts are enabled again at the end of the function
Most of the time there is no problem but occasionally it misbehaves.
I have looked at the vertical blank interrupt queue and it is not the
cause of the problem as far as I can tell so, what gives?

Thanks in advance to anybody that can shed any light on this..

Mark.

When I tried it, I couldn't get it to stop linewrapping at 80 cols,
which causes very messy displays on the system I login to - it has a
screen border.

A REALLY major "bug" with ansiterm is that it won't run on mono
monitors, and I am not prepared to subject my eyes to trying to read
small text on a 12" .44mm dot pitch colour monitor. (ie - an Atari one)

Basically, "nice to have the colours" but that's about it.

From what I've read in the nets and on GEnie, you should be able
to hook up the Falcon to just about any Atari/VGA monitor out there,
as well as to your TV set without any problem...

As for the Amiga, no doubt you could rig a cable to use it
with an Atari monitor - I'm sure people have done it before
(some people on the comp.sys.amiga.* front would be more
helpful in that regard)...

I actually use my MegaSTe on either my SVGA Multisync or a TV,
depending on the circumstance as well...

It's no problem to connect the Falcon to any kind of ATARI monitor. You
need a small adaptor (available from ATARI) to plug the SM144 cable into
the Falcon.

I don't think that there is any chance to connect the AMIGA to 70Hz
monochrome Monitor at all.

>> just trying to be as bad as the MAC?

Umm, sounds like you have some interesting problems. You might want to check
that the rail that powers the horz. defl. circuitry is up to snuff (measure
it with the screen small, then wind it out - if it sags more than about 10%
then your power supply isn't up to it)

Regardless of that, you _should_ be able to get the beam off the phosphor
and around the sides of the tube on a 124. The linearity on those tubes is
usually pretty bad though, so you may have a few hours of fun with the
magnets on the yoke 8)

>> Thanks for any help.

sr> The active display is set by the hardware in the Atari and not the
sr> monitor, try the Overscan mod and find that out...

Bollocks... the atari produces a scanline of a fixed lenght, you _should_ be
able to adjust the screen to paint that all the way across the tube.

sr> But some screen are smaller that others, my SM125 is far larger than
sr> any SM124 that I have seen and my SM125 is that same as it left the
sr> factory...

Yeah, I had a 125 as well (sold it to my g/f) - best 12" screen I've ever
seen.

sr> Roger..... sheppard_r@kosmos.wcc.govt.nz

Just a hit, roger : stick to fixing TV's - you make less mistakes that way,
and I don't have to read your drivel.

562. Chance to port term/slap to MiNT?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-01 15:22:33 UTC
From: lpressl@GWDG.DE
Message-ID: <LPRESSL.93Feb1162218@gwdu03.gwdg.de>
Source record: 40817

Hello,

does anyone of you see a chance to port term (called slap now) to MiNT
(with init, of course...). For those of you that don't know, slap is a
protocol suite / program to allow tcp/ip connections over a serial line
(like SL/IP in a way, but it's not neccessary to have root access on
either side or even to recompile the kernel). You can bind ports on
the remote host to your host, so incoming connections are possible,
too.
Obviously redirecting X connections won't work as long as there is no
X server running under MiNT... but the tcp/ip fuctions as such should
be possible. Of course it would require a lot of changes..Unix sockets
are used, I don't know of a existing telnetd, ftpd, (only the
integrated packages). Does anyone of you (with more time than me :))
wants to put work into that? You would have at least one user... :)
Or is it even already done?

Any responses are appreciated :)

Have a nice day,

Lutz

P.S.: I'd like to help if someone tries to implement this, but I
really don't have the time to do it on my own. I think there are
people more experienced in network programming, too..

564. broken mouse port?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-01 16:41:56 UTC
From: stein@phoenix.ocf.llnl.gov
Message-ID: <148514@lll-winken.LLNL.GOV>
Source record: 40819

My brother's STE has been acting up lately; he can't seem to use the mouse or joysticks from GEM (actually, I don't know if he has a problem with joysticks in GEM). However, if he runs a non-gem game, the joysticks seem to work, but the mouse still won't. Actually, if he plugs a mouse in and tries a two-joystick game, it looks like something is coming over the mouse-port because it will move his player around. The mouse seems to be fine; we've replaced it with another one. Anyone have any idea what's wrong? Will we have to get it fixed? (sorry, that last question is kinda dumb, of course we need it fixed.) Is it something we can do ourselves or do we have to find an atari dealership (which is getting harder and harder to find these days)?

The strange thing is he had this problem before, and the place we took it to replaced the entire keyabord unit and charged us an arm and a leg.

Thanks very much for any help or insight.

> the everything-is-a-file idea

I'm not sure why everyone (or anyone) thinks that's a good idea. Everything is NOT a file, that's just not how computers work. Whenever I think about it, I can't help but think of the old proverb/cliche, "When all you have is a hammer, everything looks like a nail."

This seems to be the inverse of that: when all the OS is going to give you is nails, then suddenly the only useful tool is a hammer. I don't relish the thought of trying to construct programs using only a hammer. Especially after spending 20 years building up a toolbox full of much more subtle tools.

> I'm using bits 14 & 15 of ob_flags in my GEM++ library.

Well at least I'm not the only one with the problem. This is seven years too late for action, but: The OBJECT structure really should have had a user_spec longword in it.

We library writers are left with few choices. We can set the INDIRECT flag, and then hoist the ob_spec out to our own structure which has our extra info in it following the original ob_spec. The problem is, this is such a useful technique that applications use it, and it's not a very shareable technique, so if libraries use it, then applications can't.

The other option is to use USERDEF objects, and the attachment via ob_spec is a structure that contains the extra info. The drawback to this is that you must implement a custom drawing routine for any such object. If the AES were reentrant, you could use an objc_draw() call from within the userdef drawing routine. But as things stand now, you can make only VDI calls from a userdef routine, so you have to entirely duplicate the internals of objc_draw() yourself. I had just done that when color icons and 3D objects came along. ::sigh::

> wind_new() ... only since TOS 1.04

Yep, that's true, you should check the aes version number and only use it if global[0] is 0x130 or greater.

Besides closing all windows and such, wind_new() releases any wind_update() semaphor the application may have been holding when it quit. (really, the appl_exit() call should do that, but I suppose wind_new() works even when the application bombed without doing appl_exit()).

When the application you've run does an appl_exit(), that sends an AC_CLOSE message to all accessories. The accs are supposed to interpret AC_CLOSE as meaning "any windows you thought you had open are gone now". But as near as I can tell, it is the wind_new() call that implements the other side of that; it is what makes the windows actually go away. If you tell an ACC its windows are gone, but don't do something to make that so, funny things are sure to happen shortly theyafter. On a pre-1.04 system, I don't know what you're supposed to do. Live with it, I guess.

> RADIO_BUTTON objects ... what if I have more than one set of exclusive btns

Just group them together inside an IBOX object. Set the IBOX border
width to zero and it becomes truly invisible on the screen. But it exists
as a layer in the object tree internally, and a radio button is mutually
exclusive with all other radio buttons that have the same parent object.
So the IBOX just serves as the logical parent object for a related group
of radio buttons.

I presume the "TT version" is MiNT 0.95 compiled for the 68030. If so, you might as well get that -- it should work fine on a Falcon.

The later versions of MiNT (including the version which has memory protection) are licensed only for source distribution, not for binary. Please respect these terms; if major copyright violations occur, then it is quite unlikely that Atari will give permission for its source code to be distributed in the future (nor will I be inclined to provide support for existing versions).

```
REQUEST FOR DISCUSSION
======================

This is a request for discussion on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Rationale
=========
This group will separate a section of discussion from the current
newsgroup comp.sys.atari.st and atari.8bit.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST can
continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

What a FAQ for this group could contain is also a matter for
discussion.

Discussion

Here in Germany, this upgrade is available from Application Systems Heidelberg (the distributor of Pure C) for ~200 DM (~ 140 $) (software and new manuals; software only is cheaper).

I don't have the address of Application Systems here.. email me for details.

} I can't help but think of the old proverb/cliche, "When all you have is a
} hammer, everything looks like a nail."

Hmm - I'm not sure what couldn't be expressed as a file in the computing model we have today. Basically the 'EIAF' idea is to do with communication between peripherals and the CPU. Since all comms is going to be in the form of a stream of data, what is wrong with looking at it as a file - and look at the strengths that gives you.

The idea that anything's input can be redirected to anything's output is *incredibly* powerful. I'm not talking about programs, but about devices as well. In general (sic), generalisation is beneficial, precisely because it gives you *more* tools to attack a given problem with, and doesn't limit you to using XXX to solve problem YYY.

}
} This seems to be the inverse of that: when all the OS is going to give you
} is nails, then suddenly the only useful tool is a hammer. I don't relish
} the thought of trying to construct programs using only a hammer. Especially
} after spending 20 years building up a toolbox full of much more subtle tools.
}
} - Ian

But those subtle tools of yours are specific to a particular problem (at least, that's what I assume you mean by 'subtle'). Under un*x you have a myriad of tools to solve any problem to do with comms, because everything is a file.

The best example I can think of is the un*x debugger, which attaches to a running program, and regards it as a file, that is it stops the program when it has 'read' a little of what it has done, and lets the user decide what to do next - continue, look at memory/variables etc. This isn't an immediately obvious benefit of the EIAF idea, but it isn't possible without writing specific code elsewhere.

I might be blinding myself here, but I can't see what's wrong with having more utilities that work under more conditions...

Simon.

575. SUMMARY: file ttransfer UNIX -> Atari

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-01 22:36:47 UTC
From: jans@candida.nada.kth.se
Message-ID: <JANS.93Feb1233647@candida.nada.kth.se>
Source record: 40829

A few days ago, I posted a question about how to transfer files from a UNIX workstation to my newly bought Atari. Thanks to the helpful letters (and post) I received, I succeded in this venture. As m0ali001@ulkyvx.louisville.edu (M Ali) pointed out, the trick is to transfer the files to LOW DENSITY (720k) PC floppies, which appearently the Atari manages to read. I used Apple fileconverter to do this.

An email from toef@ukc.ac.uk (Tom Fuegi) verified this, and he furthermore recommended me to henceforth use my terminal program to transfer files. I certainly will, as soon as I understand the Kermit mode of UniTerm. He thought it wise to grap the file /atari/starter.tos at atari.archive.umich.edu so that I should be able to unpack files locally on my Atari; however I think I will use the UNIX versions of zoo et cetera and do the unpacking on my SUN.

Chris.Forker@newcastle.ac.uk on the other hand pointed out a more direct route. He said, I quote:

>If you can transfer information too a PC form your SPARCII then you
>can also transfer info to the Atari. Just insert a disc from the Atari
>into the SPARC and use your local method for mounting the floppy on
>the Sun. You will now be able to transfer data from the Sun onto the
>floppy. Un-mount the floppy drive when you have finished, then eject.
>Take the disk to the Atari, and with any luck you should have all the
>files you copied. When you move files from the Atari to the Sun using
>the procedure as above, do not forget to use the command `dos2unix'.
>This will make the files readable by UNIX. The Atari uses the same
>format as the PC in placing `^M' at the end of each line..
...

>PS- my commands are
>1) to mount the floppy: mount-fd
>2) to unmount the the floppy: umount-fd
>3) to ejetc the disc: eject
>4) the floppy drive is : /pcfs
>5) just use standard UNIX commands to access /pcfs

I have not tried this, but the manual entry for pcfs says

DESCRIPTION
PCFS is a filesystem type that allows users direct access to files on MS-DOS formatted disks from within the SunOS operating system. Once mounted, a PCFS filesystem provides

...etc, and generally supports Chris's claim. I did not know this. I thought the floppy was located somewhere under /dev/rsd0... You learn something every time you ask):.

My thanks to thoose who helped me.

Toad Computers had the Pro utilities package and manual in the store
when I was there on Saturday. It could have been a pre-release
version, but it certainly looked "production". I believe it was
selling for approximately $65. I don't think it had Cleanup packaged
with it, but I may be wrong.

I have to agree. One thing files do not really have is a time dimension. Unix suffers in the areas where it attempts to bolt the dimension of time onto the file paradigm. For instance, is there a key being pressed NOW on the keyboard? No, I don't want to read the value of the key, I want to know how long it was pressed. Signals and alarms are not files (at least under Unix -- I don't remember whether Plan 9 changed this or not.) Anyway, it seems like the "hammer' can be a little overkill when all you want to know is if a bit in an I/O register is set or cleared.

> load...under Unix is the number of processes that are in the "runnable"
> queue. Using that measurement, you always get "1" for ordinary TOS.

Not true. It possible, and not even uncommon, for there to be more than one process waiting for execution cycles at any given time. The difference between "ordinary TOS" and MiNT is that with the former, several of the processes might be desk accessories, but only one of the processes can be a .PRG type program.

Under MiNT, the number is either 1, or at-least-1-more-than-your-machine-can really-handle.

Message-ID: <mjmcken.728617622@unixg.ubc.ca>
Source record: 40836

I'm about to upgrade my 520STfm by adding more memory and an external 3.5" drive as explained in the files on atari.archive.

Before I do this, can anyone offer any comments regarding these files? Are they completely accurate?

I have the same board revision that the author of 2_5ram.zoo has, so hopefully everything will go smoothly.

Comments are appreciated.

Mike.

583. HSC140 - AR.TTP is broken

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-02 02:29:33 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Feb2.022933.10262@mnemosyne.cs.du.edu>
Source record: 40837

I have received a variety of reports that AR.TTP in the HSC140 release is broken. It dies in various way (usually 2 bombs) on different machines. (It works just fine on my 14mb Falcon, so it's probably writing to memory it doesn't own, and it just doesn't hit anything real on my machine). For the time being, fall back to ar.ttp from the v1.3x release. (The only difference is that the new version does ARGV args, prior versions don't.)

I'll look into this and post a fix ASAP.

Have you tried ConNect 1.91? It has an ANSI/VT102 mode, with what I
can tell is proper ANSI and VT handling. Of course, color-wise, you're
limited to what the particular graphics mode can display.

So of course, 2 colors in mono, 4 colors in Medium res, and 16 colors
in LOW res. Just for kicks, I loaded MonSTEr in low res (giving me a virtual
screen of at least 640x200) and ANSI-16colors worked fine. If only
I didn't have to scroll the screen (MonSTEr)...

However, I would assume that if you have a graphics mode that
does support the 16 colors (Crazydots board, TT 16-color modes, Falcon
16-color modes) then you should be able to get good ANSI emulation in
full color...

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

oh, under the simulated 640x200x16 low res mode, I viewed a couple
pictures that were converted from GIF to ANSI (like the Bugs Bunny
picture) and they looked pretty good...

>Most of the time there is no problem but occasionally it misbehaves.
>I have looked at the vertical blank interrupt queue and it is not the
>cause of the problem as far as I can tell so, what gives?

I assume the keyboard processor is the cause of your problems. When you lock interrupts for a long period of time (which you should not do anyways) data that is to be transfered from the keyboard processor to the ST gets stuck. Eventually there will an overrun in the keyboard ACIA. Once interrupts are released the OS will get quite confused by the state of the ACIA and will receive lots of $00-Bytes. The OS could probably recover by looking at the overrun bit of the ACIA but none of the current versions do this :-(Since $00 is the scancode of the ESC-key, the computer is now receiving lot's of ESC's. Since ESC causes the desktop to refresh it's windows, this is the effect you mentioned in you message.

Workaround:
1) Do not lock interrupts :-)
2) If you have to lock them, lock them for a short time and stop the IKBD first (cannot remember the appropriate OP-code offhand); allow some time for the IKBD to actually stop.
3) After releasing interrupts, clear the overrun bit. For doing this you might have to do some detection of packet-structure...

I hope, this helps you...

|> provide support for existing versions).

That's all quite ok to me and I think that I truly respect the work that's in this software and I'm *very* happy that I can get these things for free, but, what I do not understand at all: How to you want to prevent people from breaking copyright laws by only allowing the source distribution? What's the difference between me copying my compiled version for a friend, and me copying the source code plus a C compiler, who's binaries are for free? In my opinion distributing the source code is even more dangerous because I can make much more bullshit with it than with the binary form. The only idea which pops up in my brain might be that they want to suppress dealers to distribute it commercially...

If you have two (or) more sets of radiio buttons, then just place each set
inside a G_IBOX. The radio button attribute works with objects belonging to
the same parent. The G_IBOX's will seperate them from each other.

BTW, while we are at resources : I always used to type the resources in the
code myself, but I'd like to try some Construction Set. Is there any
available on ftp ? Thanks.

Patrick.

b>I plan on installing Overscan3 from a.a to my 4 meg STE. Does anyone know
b>if there is any difference installing it to STE then ST?

The difference is: It doesn't work on STEs. The signal Overscan modifies is no longer available on the PCB of STE computers; the two chips that used this signal have been integrated into one.

b>If i must have some sort of driver, cables etc...

First, you need Atari's drive mounting kit. It includes SCSI adaptor, cables and even the screws needed.

Then you can add any 3,5" SCSI drive, IF parity can be turned off on the drive.

That's a rather contentious statement. How would you prefer MultiTos to go from a users point of view? The Unix-like nature of the underlying system isn't going to effect the desktop, nor will it effect CLI users directly, since with Unix underneath the CLI can be made to feel like whatever you want. I really can't see any justification for this statement.

I have an Atari 1040 ST (without a hard disk) and a Macintosh IIsi (with one). I was wondering whether I could (and if so, how?) --

i) use the Atari as a Macintosh through some kind of software or hardware emulation package. If so, which one is good? (Another thought: Are there IBM-PC emulators for the Atari as well?)

ii) use the Atari-emulating-a-Macintosh on an AppleTalk (or other) network to talk to the Macintosh-being-itself.

iii) use the Atari as a "terminal" and connect to the Macintosh IIsi (which would then run in two-user mode).

iv) use the Atari as itself but have it use the Macintosh's hard drive as a file server.

v) any other ideas?

Thanks,
Ashwin.

Hi there! Recently I've been having some trouble with my Mega 2. At first, when I turned it on, the monitor would stay black and I'd hear a faint hissing sound from the speaker. Then, all of a sudden, it would pop on and be fine. As time went on, this "blackout" startup would take longer and longer. Sometimes even after it started up, it would spontaneously reset itself a number of times before booting. Finally, it seems to have died.

Initial evaluation: The power supply is toast (well it is almost 6 years old!)

So what do I do? I open it up, and I find the 250V 47mfd capacitor blown with burnt ooze around its base. I replace it. I turn the computer back on and, nothing happens.

It seems that as long as the power supply is not connected to the mother board, it works (puts out 12 and 5 volts, fan works fine). As soon as I connect it to the mother-board, it's drained (put's out 6 and 2.5 volts, fan is weak and needs a "nudge" to get going.)

It seems that the power resistors in the vicinity of the blown cap are all ok, and the only thing more I can check is the big 16V 4700mfd cap on the motherboard. Has anyone else encountered a similar problem and know of a probable cause? I hate to think my motherboard is shorted and draining the power supply. I'll have to send it to Atari for god knows how long while they replace the sucker.

Email replies please.

[assuming you know the original message]

1) Yes you there is a MAC emulator, Spectre GCR. There used to be another but that was long ago.

2) No. If you had a MegaST and the Mega-talk board then supposedly you could.

3) Sure any terminal emulation package

4) No. Many problems here, the least of which is the Mac's file names.

> it takes the 386SX two instruction cycles to access 32 bits where the
> 68030 takes just one.

That's wrong. It takes the 386SX two bus accesses to move 32 bits, and it takes the 68030 just one. But a bus access does not equal an instruction cycle. The Falcon's 16mhz 68030 is riding on an 8mhz memory system. While the 68030's onboard caches certainly help, accessing memory is one of the Falcon's weak points. (I believe it takes 4 CPU cycles to access memory on the Falcon, but I could be wrong about that.)

> Add to this the fact that most 32-bit fetches are for the instructions.

A completely invalid generalization for both chips. The 386 has a set of instructions that operate on multiple memory locations (REP MOVS, REP STOS, etc). The 68030, with its onboard instruction cache, can run for a considerable amount of time without needing to access memory to fetch new instructions.

> The Falcon will be a state of the art machine.

To me, a state of the art machine (considering affordability, not what can be done on a labratory bench) is a 386DX or 486DX running at 33mhz or better, with at least 64k of fast SRAM cache in addition to on-chip caches. It includes graphics up to 1024x768x256color non-interlaced, and quite likely truecolor (real 24bit truecolor, not 16bit hicolor). Obviously the Falcon 030 doesn't do all that. But then, it's likely to be cheaper than the 386/486 system, I suppose.

> [The 386 would have to run much faster...] to compensate for the speed
> loss because of DOS and the BIOS.

Given that GEMDOS is virtually a clone of MSDOS, that doesn't seem to be a very valid point. And it doesn't even address the fact that MSDOS is the slowest of the DOS options for the 386 world. OS/2 blows it away, and we have nothing like OS/2 for the ST world. (Speak not of MiNT; it is an abomination, not an operating system.)

>this software and I'm *very* happy that I can get these things for free, but,
>what I do not understand at all: How to you want to prevent people from
>breaking copyright laws by only allowing the source distribution?

If the license allows only source distribution, then any other distribution is a violation of copyright. I think what you really wanted to ask was: "Why does the license say only source distribution?" The answer is, basically, that we want to make it absolutely, unequivocally clear that this version of MiNT is unsupported. If there are problems, you will need the source code to fix them. Moreover, the way I persuaded my bosses to allow this distribution is that I pointed out to them that by giving away the MiNT source code, we greatly expand the number of people who can find and fix bugs in MiNT, and provide enhancements to MiNT. That's obviously in everyone's best interest, so they agreed -- but it's something that only happens with the source code distribution.

(People who want a binary only version of MiNT can get MultiTOS; it should be available to the general public very soon now (note that I did *not* say "real" soon now :-)).)

Source record: 40767

HELP!

I recently found the file sozosun.zoo on atari.archive, and after reading the description I thought I'd try to compile sozobon C on a Sun Sparc.

This would enable me to compile large programs(such as PoV) on my 1 meg HD-less ST.

I followed the instructions, but when I try to compile it, I get hundreds of errors, mainly 'syntax error' and 'undefined'.
The doc says obtain the source for v1.4 from atari.archive, but I can only find v1.2 ,v1.33i and v2.0.

At the moment I am using the source from the file sozobon2.zoo at a.a. The info in this package says it is v1.2, but the version numbers in the individual programs say v1.01(this may be due to them not being updated when the source was).

When I 'patch' the files, only about half of the patches in the .diff file are carried out - I think this must be the problem.

My last question is why do the source files have ' ^M ' at the end of each line and on blank lines when viewed in jove, they are fine when I 'more' them. Could this be another problem?

I would really appreciate any help with this.
Thanks

Paul Donovan

608. Clarification of interrupt problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-03 01:31:39 UTC
From: mmartin@neumann.une.edu.au
Message-ID: <mmartin.728703099@neumann.une.edu.au>
Source record: 40761

Regarding my last post:

I am having problems implementing a sample playback function in program I am writing on ST. The function is written in assembler and it is linked to a GEM program using Pure C. When the function exits the program can get quite unstable; there are repeated window restore messages, the cursor in the file selector box flashes and if I quit the program the directory window is continuously updated. It looks like it's working off interupt messages accumulated during the playback function where they are turned off using xbios to get into supervisor mode.

It seems that I was a bit ambiguous about my reasons for turning off interrupts. They are disabled so that the cpu can deal exclusively with the signal without also having to cope with regular interrupts which would cause the signal to break up. I should also say that the signal goes through a D/A converter via the cartridge port and that the computer is sometimes unstable when the converter is plugged in, but I don't think that this is the only cause of the problems that I mentioned in my original post. It now seems that the main problem is actually some kind of loop that occurs after the sample playback function exits... I have no way of checking if this is related to the converter because I can't get hold of a different converter in order to see if the same thing happens, so I am posting this in the hope that someone who has done this sort of thing before can point me in the right direction.

Mark.

MMU chip replacement may solve your problem.

I had same experience as yours after SIMM memory upgrade with old 1040f;
Internal floppy drive got crazy and no sound at all, however other
components continued to work flawlessy including HD with ICD adaptor.
Sometimes drive and sound worked just after boot for a while.

I checked power supply voltages at every suspecious points and resulted
in vain. Thus I drawed the conclusion I damaged circuit with my novice
soldering, got (aged, but sligthly newer than mine) 2nd 1040f for replacement.
Before I settled memory upgrade kit, I popped the MMU chip up from 2nd
1040f, insert it into older one. IT GOT WORK WITH CHARM. It seems original
MMU chip is so faulty that it can not handle unordinaral configuration.
(I desoldered all original DRAM chips on PCB) I donot confirm yet that old
MMU does NOT work even with 2nd 1040f.

I hope this information be your help.

A PC-clone is in no way a 'state of the art' machine, it's a very crippled
architecture from the early 80's. And the cost for what you are calling
a 'state of the art' machine above you could easily buy a SUN SparcClassic,
and that is a state of the art machine. (And it's atleast 3 times as fast)

I doubt that this will always force a disk access. You'll have to use Atari's
hack (as published in the Rainbow TOS Release Notes and everywhere else), or you
can use two Dlock's when running MiNT. Note: when running an XHDI compatible
harddisk driver, you can get the BPB without having to care about this GEMDOS
stuff.

There are both Macintosh emulators and PC emulators for the Atari ST. I
think the most popular Mac emulator is called "Spectre GCR" or something
like that.

> ii) use the Atari-emulating-a-Macintosh on an AppleTalk (or other) network to
> talk to the Macintosh-being-itself.

You'd probably need to fabricate your own cable, since the ST doesn't
have an AppleTalk port.

> iii) use the Atari as a "terminal" and connect to the Macintosh IIsi (which
> would then run in two-user mode).

"Two-user mode"? I don't understand. You can have the two computers
"talking" to each other by using terminal programs on each one and
connecting them with a null modem.

I second that, with one small suggestion: You don't need to actually
open a file on the drive, a small Fsfirst("X:\\*.*",0) (where 'X'
is the drive ID) is sufficient, and it's faster.

614. ATARI Mega ST2 (4 MB) for sale

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-03 10:48:58 UTC
From: danny@nessie.mcc.ac.uk
Message-ID: <1993Feb3.104858.27007@nessie.mcc.ac.uk>
Source record: 40790

FOR SALE :

ATARI Mega ST2 (upgraded to 4MB),
SM124 Hi-Res Monochrome Monitor,
Recently serviced - has a 3 month warranty (within the UK).
Masses of software originals, including,
1st Word Plus
Outline Art
Degas Elite
Neodesk 3
ST-Basic
..and others which I can't remember off the top of my head,
all with manuals,

for 450 quid (or best offer)

Cheers,

Danny

615. Memory Upgrade 1MB -> 4MB

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-03 13:26:05 UTC
From: silvera@p4.cs.man.ac.uk
Message-ID: <1993Feb3.132605@p4.cs.man.ac.uk>
Source record: 40764

I need a bit of help regarding upgrading my STFM from 1MB to 4MB.
Currently my ST contains 32x256k chips which fills up the whole board.
Which would be the best method to upgrade to 4MB?

a) Get a SIMMS board and (is it possible?) use this WITH my existing RAM?

b) Throw away all the RAM and get a new set of 1M chips.

Any ideas please my email to: silvera@cs.man.ac.uk

Thanks.

616. TurboST bug with FontGDOS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-03 14:38:29 UTC
From: cjr@cs.bham.ac.uk
Message-ID: <C1vnC6.L2s@cs.bham.ac.uk>
Source record: 40770

Folks, I've just discovered that Turbos ST 1.84 (is that the latest? It has been out a while...) kills the bezier curve function in FontGDOS (v_bez - rave on :-P). Instead of a nice curvy shape, it draws a zig-zap (not even a similar shape :-(

I get the same problems with the AUTO version (fiddling the AUTO order doesn't do anything), and the ACC version. No joy.

T-ST should ignore all VDI opcodes it doesn't understand, IMHO, but it doesn't appear to.

Any suggestions anybody?

I think it's a wise choice--- bits 9 and 10 for the 3d objects. I guess quite
a few programs are using bits 13--15, just because they appear on the left in
most RCS's. My programs do, but I will change that now. But if I were Atari,
I'd never touch 13--15. Even a better choice would have been 11 and 12, so that
neither people who use the highest bits neither those who choose to use the
lowest 'reserved' ones, 8, 9 and 10 would get problems.

There you go. Personally I think that was a good move. If Atari were going
to add any bits, they would start with the lowest available ones. Now, I
think it should be officially admitted that using 13 upto 15 is so common
that it should be legalised.

620. Re: ST Sees No Disks, Has No Sound

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-03 15:09:43 UTC
From: nrc@cbnews.cb.att.com
Message-ID: <1993Feb3.150943.21201@cbnews.cb.att.com>
Source record: 40765

Thanks to everyone who responded to my question about my ST which
didn't recognize the disk drives and had no sound.

I suspected that it was the Yamaha chip since as someone pointed out,
it also provides the drive select lines. I intended to heat up each
of the solder joints before replacing the chip but I figured I'd tap
around on it a bit first. I had already reseated and tapped on
everthing else, the Yamaha chip is hidden under my memory upgrade
board.

A few taps on the Yamaha chip and the machine booted up just fine.
Sound and drive access is back to normal. It sounds like I probably
have a poor connection to the sound chip so if the problem resurfaces
I'll just resolder it.

Thanks again for your input.

From: ifav503@ccwf.cc.utexas.edu
Message-ID: <1kp0jpINNq2q@geraldo.cc.utexas.edu>
Source record: 40766

I am using gnuplot (not a part of the GNU project) for some frequency response analysis. It has output for the LaTeX picture enviroment, but suggests using the EEPIC or EPIC environments.

I saw these environments available in TeXDraw but I never got them to work. What does one have to do to get the EEPIC environment to work with CS-TeX on the Atari-ST? I believe that extra fonts or some interface to the previewer and printer code is required. Has anyone here do it?

Does anyone use TeXDraw? I believe that the author abandoned the project when it was nearly finished. I would take over the project, but I am not fond of Pascal and I don't have a MiNT compatible Pascal compiler.

By the way, where can I get a FAQ about TeX/LaTeX related programs. I don't mean a document explaing how to use TeX/LaTeX but a FAQ describing the available tools for TeX/LaTeX and how to install them.

> How would you prefer it to go?

Hmmm, fair question. I guess I'd like to see it go in the direction of the Macintosh system software: you plug it in, you turn it on, it works. You don't have to read wieghty tomes and spend days trying to get the thing running. You don't have to spend even more days figuring out which of your existing applications will work and which don't. You don't have to constantly reboot your machine with it and without it, because its basic design is just incompatible with some kinds of software.

"Everything is a file" makes for a very elegant and almost seamless integration of all the facilities of a computer *and all the other computers on a network*.

The "everything is a file" idea really comes into its own when you make CPUs and applications look like files. This means that you can (almost) seamlessly add and remove processing power and applications.

Need some more processing power? Simply mount another /dev/cpu and away you go (there is a kludge for the inherent problem of not being able to run, say, 68040 binaries on a SPARC). I suggest you read the Plan 9 papers, where these ideas are explored and evaluated.

The only reason ulong should not be defined is if the symbol dLibs is
defined in mint.h. Check mint.h and make sure dLibs is *not* defined.
If it isn't and you're still getting problems, do a gcc -E bios.c -o bios.cpp
and check the preprocessed output to see that the right types.h was included
(it should be the one from the mint directory, *not* the one from the library
includes).

Source record: 40773

In all this debate about PCs and Falcons, I have seen a lot of words and no numbers as a sound basis of comparison. So far, no facts have been determined and nothing useful said. Since there are many types of PCs around, it would be useful to determine how fast a PC you need to equal the speed of a Falcon for non-numerical and numerical applications. That has not yet been established in all this argument over 16-bit, 32-bit, etc. architectures.

The simple way to establish computer speed is to run benchmarks. A controlled experiment would involve running the same benchmarks on a Falcon, a 386-25SX, 386-33DX, 486-25SX and a 486-33DX, using the same compiler (gcc comes to mind). I know no facts, but I suspect the Falcon will fall somewhere inbetween the 386-25SX and 486-33DX. Incidentally, unless you can run general-purpose benchmarks on the DSP chip, it is not usually useful to talk about the speed of the Falcon in terms of the speed of its DSP chip.

Once the speed of the Falcon has been determined, we need to carefully determine how much an equivalent PC would cost. A little bit of price shopping determines this for any local area. PC (and probably also Falcon) prices, however, vary all over the world, so a price comparison for the UK will not necessarily be valid for the US.

Furthermore, the price comparison should be broken down for the PC, since the Falcon comes bundled with some hardware pieces which are optional on a PC (MIDI, DSP). Some computer users may not want those pieces and if they chose to purchace a PC, would go without them.

I'd be very interested in hearing more about this too. I'm not
familiar with EEPIC/EPIC, although I've seen the acronyms a couple of times.

>Does anyone use TeXDraw? I believe that the author abandoned the project
>when it was nearly finished. I would take over the project, but I am
>not fond of Pascal and I don't have a MiNT compatible Pascal compiler.

Actually, it's Modula-2. I just acquired a Modula-2 compiler (The TDI
one), and am going to see what to do about TeX-Draw just after I
figure out the appropriate commands to make it work with GNU-Make. It
should be quite practical, I expect.

I don't have a mono monitor, and so have only made VERY limited use of
TeXDraw. If it was color compatible, I probably would have had more
diagrams in my thesis (submitted last Friday).

>By the way, where can I get a FAQ about TeX/LaTeX related programs. I
>don't mean a document explaing how to use TeX/LaTeX but a FAQ describing

I'd suggest taking a look around Comp.text.tex, for their FAQ. As far
as using the tools on the Atari goes, it's a little difficult to find
information.

I'd like to find out if the New Font naming System can be used with
CS-TeX; it APPEARS not, but I'm not certain. What I'd like MORE is to
figure out how to add extra "funny fonts," as my attempts to do so
have been unsuccessful to date.

```

```
The code originally posted WILL perform properly as advertised. The point
was not to force a media change (the subject covered "in the Rainbow TOS
Release Notes and everywhere else"). The point was to read the BPB in a
way that wouldn't cause GEMDOS to lose track of a possible media change.
The example code as shown does exactly that: in response to the Fopen()
call, DOS will check for a media change, and if one occurred, it will do
its own Getbpb() (which clears the "has changed" status). Following that,
you can safely do a Getbpb() call yourself, because you won't then be
changing the media change status in a way that causes DOS to miss the change.

Whether any physical disk activity actually occurs is not a factor in any
way.
```

>> The Falcon's 16mhz 68030 is riding on an 8mhz memory system.
> I wonder where you got that idea?
> If it was 8mhz it couldn't handle the graphics it says it can.

Do you have numbers to back that up? Consider that the Falcon cannot even
do 640x480x16bit hicolor mode on a VGA monitor. Why not? There isn't
enough memory bandwidth. Even at lower resolutions, the video steals
quite a few cycles from the processor, based on some empirical timings
I've done in trying to pump animation graphics at high speed at 640x480x8bit.

I could be wrong about the 8mhz memory system, maybe it is 16mhz, and I'm
just totally spoiled by my msdos machine, which can do graphics at about
(subjectively) a bajillion times the speed of the Falcon.

634. GEM++ 1.2 - C++ clases for GEM - now available.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-04 02:27:08 UTC
From: warwick@cs.uq.oz.au
Message-ID: <11948@uqcspe.cs.uq.oz.au>
Source record: 40777

I have uploaded "gem++12.zoo" to Atari archive - should be appearing in
/atari/Programming shortly.

This is a set of C++ classes that allow easy coding of GEM interfaces.

By using the "INDIRECT" flag of the GEM OBJECT structure, we have tightly
coupled our GEMobject class to the standard GEM OBJECT, thus allowing for
simple and efficient call-backs.

Included in the library are classes to perform:

gemap - Application registration (appl_init, appl_exit)
gema - Activity (the event_multi loop)
gemal - Alert (RSC-based alert boxes)
gemd - Desktop (replace desktop with form)
geme - Events (event_multi events encapsulated)
gemf - Forms (Dialog boxes)
gemfs - File selector (File-selector with nice programmer interface)
gemfw - Forms in Windows (active dialog boxes as window contents)
gemhf - Hot Forms (like popup menus)
gemimgo - Image object (IMG files give contents of GEM G_IMAGE)
gemks - Key Sink (where hey events go to)
gemm - Menus (Plain old GEM menus)
gemo - Objects (The basic GEM OBJECT - extended)
gemr - Resource (rsrc_load)

635. Floptical Drive Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-04 02:33:11 UTC
From: beureej@newton.ccs.tuns.ca
Message-ID: <1993Feb4.023311.16104@newton.ccs.tuns.ca>
Source record: 40778

I've recently bought one of those 21meg floptical drives (you know,
the cheap kind from the colored mountain place). I've been experiencing
some problems with it, and thought someone here might be able to help me
so I don't have to run up a huge phone bill asking the people I bought it
from.

Anyway, the problem is that one of the disks seems to have a bad sector.
I'm using the ICD utilities with the Link on it. If I partition the
disk with a 1 pass verify, everything seems to be fine until I get about
2 meg of data on it, and then the drive acts as if the power is turned off
and on, then just keeps seeking back and fourth. Anyway, I re-partitioned
with a 4 pass verify, but when the partitioning reached around sector 29440,
the drive started seeking back and fourth for a bit, and then I got a
'drive C not responding' message reporting a sense code $FF. If I partition
with 1 pass, which seems to work, then use the utility prg to map out
bad sectors, it doesn't find anything wrong!

The rest of my disks seem to work fine, so I thing its the disk thats
causing the problem, but I can't seem to fix it with ICD's utilities.
I'm using a 1040STfm, 1 meg with TOS 2.06. Any suggestions?

Another thing worth mentioning...after the partition that didn't work,
I couldn't use the drive for a while. When I would change disks or
turn the power off and on, it would just make a humming noise like
the heads were stuck. After leaving it off for a few minutes it
seemed to work. I'm really beginning to wonder about the quality...

Any help would be really appreciated.

Jerry (beureej@newton.ccs.tuns.ca)

PS While I'm on the subject, does anyone know how to set up the
floptical to boot the computer. Its already drive C, but the
ICD utilities say that it doesn't support booting. Is there
some way of changing this?

636. MIDI & MultiTos/Falcon030

Newsgroup: comp.sys.atari.st.tech

Source record: 40782

Greetings,
I have a couple of questions with regard to the way MIDI programs (e.g. sequencers) will work under MultiTOS on the Falcon. I realize this is purely hypothetical at present, but perhaps some of you MiNT-knowledgeable folks can make some educated guesses.

1. I understand that many sequencers install their own MIDI interrupt handlers; what implications does that have for multiple MIDI applications under MTOS? Apparently these new handlers are necessary because the OS routines can lose data when the mouse is moved or a key is pressed; does the higher processing speed of a Falcon obviate the need for such hijinks?

2. Would it be possible to have a task run concurrently with a sequencer and have it intercept the MIDI data stream on the way to and from the sequencer? As a blue-sky example, imagine an improviser/accompanist process, which analyzes the outgoing MIDI (from a concurrently executing sequencer process) and the incoming MIDI (from a human player), mixing into the MIDI streams additional notes it has chosen to fit the current rhythm and harmony. Is MTOS' multitasking sufficiently fine-grained to allow this sort of co-processing? Are there provisions for one process to "redirect" another's MIDI I/O?

I eagerly anticipate any and all replies, by post or by e-mail. Thank you in advance.

Let me guess - you have a monochrome system.

You're right of course, this shouldn't happen.
(Yes, it does work OK if I switch to my colour monitor, but that's got
lousy resolution)

I still don't believe that :-) Even if this works as you think (which might
not be true with large GEMDOS buffers or other file systems), you might
still run in race conditions where you actually skip one media change.

|> that only happens with the source code distribution.

I can see that you're now having "problems" when speaking about MiNT, now that
you represent a bigger company (see you signatures). It's just that for a
normal, mortal user it's a bit difficult to deal with the obviously new
strategy Atari uses for feedback from users, don't know how about developers,
but at least it was often enough reported to be rather bad.

|> (People who want a binary only version of MiNT can get MultiTOS; it should
|> be available to the general public very soon now (note that I did *not*
|> say "real" soon now :-)).)

See, that's the point I'm a bit afraid about. Looking at the prices for older
TOS upgrades I think it's a bit too suspicious and too unprobable that THIS,
probably the best version Atari ever released of its OS, should come for free.
And I doubt that you would like to spend your time for nothing to give support
for a second, public domain or so, version of it. Don't know about the details
your deal with Atari includes, so please don't show this letter to them, in
order not to lead them to bad ideas :-) ...

640. MIDI/KEYBOARD PROBLEMS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-04 13:23:15 UTC
From: a908570@server1.tiuk.ti.com
Message-ID: <1993Feb4.132315.25426@csc.ti.com>
Source record: 40693

I've been suffering from a MIDI problem I saw mentioned in a
message 'MIDI & MutliTos/Falcon030'.

I have some C code which uses Bconin etc to send MIDI data around
a ring. Everything is fine until I start hammering the keyboard then
bytes occasionally get corrupted. I'm fairly sure the problem is
not in my code, I've managed to reproduced the same problem in a couple
of different languages.

Midi and keyboard events are handled by the same ACIA, and so I've
suspected the interrupt handler for quite a while. I had a look
through the interrupt code but couldn't spot any obvious mistakes.

Does anybody out there:-

1) have (or know how to get) a patch for the problem.

2) know the details of what is wrong with the OS midi/keyboard
routines, so I can avoid making the same mistakes when I write my own.

Thanks,

John Keay (a908570@server1.tiuk.ti.com)

641. IKbd

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-04 14:37:02 UTC
From: leo@dcs.warwick.ac.uk
Message-ID: <1993Feb4.143702.5494@dcs.warwick.ac.uk>
Source record: 40696

Here are more details of the IKbd (Intellegent Keyboard) handling on the ST, as promised.
The Ikbd chip sends data to a ACIA (Async. Comms. Interface Adapt.) on the motherboard via a serial link. This ACIA, and another one handling the MIDI port interrupt the processor via the MFP (Multi-Function Peripheral) when a byte is received. On the ST the MFP is in autovector mode with vectors starting at #64, and as both ACIAs are at level 6, the processor will jump through vector 70 (This corresponds to $118 on STs, but it is best to change it via Setexc(70,...) for compatability). The vector points to $FC29CE on my TOS V1.02.
The following bit of C defines some system variables I mention in the disassembly below.

```
typedef struct Address (TOS dependant)
{
void (*midivec)(void); $E12
void (*vkbderr)(void); $E16
void (*vmiderr)(void); $E1A
void (*statvec)(void); $E1E
void (*mousevec)(void); $E22
void (*clockvec)(void); $E26
void (*joyvec)(void); $E2A
void (*midisys)(void); $E2E
void (*ikbdsys)(void); $E32
} ACIA_VBASE;

ACIA_VBASE base=Kbdvbase();
```

Here's the partial dissassembly I promised:

```
*-------------------- ($118) --------------------*
00FC29CE MOVEM.L D0-3/A0-3/A5,-(A7) * Save registers
00FC29D2 LEA 0,A5 * Clear A5 for faster 16-bit addressing

*-------------------- ikbd --------------------*

00FC2A50 TST.B $E36(A5) * Are we half way through a packet
00FC2A54 BNE.S $FC2AB6 * If yes, jump somewhere
00FC2A56 CMPI.B #$F6,D0 * $F6 and above head data packets
00FC2A5A BCS $FC2B5C [keypress]* Less than $F6 - keypress/release

...(Handle status, mouse, clock and joystick packets through vectors)

*------------------- keypress ------------------*
00FC2B5C MOVE.B $E61(A5),D1 * Get shift status (Kbshift value)
00FC2B60 CMPI.B #$2A,D0 * Left shift pressed?
00FC2B64 BNE.S $FC2B6C * No, jump over
00FC2B66 BSET #1,D1 * Set left shift bit in D1
00FC2B6A BRA.S $FC2BE0 * Jump over
00FC2B6C CMPI.B #$AA,D0 * Right shift released?
00FC2B70 BNE.S $FC2B78 * No, jump over
00FC2B72 BCLR #1,D1 * Clear left shift bit in D1

...(And so it goes on for each shift key)
```

Print screen and reset keypresses are also handled here. Proper keys are inserted into the keyboard buffer, and autorepeat counter initialised.

```
*---------------------- midi --------------------*
00FC2E34 MOVEA.L $E12(A5),A2 * Set A2 to (midivec)
00FC2E38 JMP (A2) * Call (midivec)
*------------------------------------------------*
```

There are a few conclusions to draw from this:
Firstly, any routine that you place at (vkbderr), (vmiderr), (ikbdsys), (midisys) must either exit with RTS, or preferably (in the case of the last two), jump to the old routine. My documentation says they should return with RTE - In the case of (ikbdsys) this would cause corruption of the A5 and A2 registers every time a key is pressed!
If you want to detect keypresses even when (ikbdsys) has been replaced with a routine that doesn't call the old one, simply change vector 70 to point to your own routine (which should called the old one afterwards). The disassembly should give you some idea what you should do (but remember addresses above $600 are almost guaranteed to change between TOS versions). (ikbdsys) will be called when a a midi byte is received, and vice-versa, so if you patch at this level you must check that a character really is available from that ACIA.

In summary, the whole thing is a mess and that guy who said that despite Atari's marketing, organisation and business sense, their technical work was actually quite good the other day doesn't know what he is talking about. For example, when patching (ikbdsys), you have to check that the byte really came from the IKbd and read it by accessing the hardware directly. If TOS only called the routine when a byte is from the Ikbd (as per it's specification) and loaded the byte in D0, Atari could change the keyboard processor at any time without incompatabilities. Key handling would be faster, more compact and easier to patch.
A good project/exercise would probably to rewrite the whole thing from scratch (especially if you have TOS before V1.04 where keyboard repeat and buffer overflow checking are buggered and keyboard reset not implemented). However, the same can be said for just about any part of TOS.

BTW, all but the newest and fastest MS-DOS machines use an 8-MHz system bus. This has caused problems in making fast graphics, which have been solved in various ways, usually by making a fast proprietory bus. A new fast-bus standard for PCs is just coming into use, and promises to eliminate the old proprietory buses.

I don't know what bus the Falcon uses.

I'm posting this for my mother really.
She's trying to print out from the CALAMUS DTP paclage to
the laser printer, but so far has failed to get anything out.

Is there some special driver which needs to be
installed at boot time ? Is it possible at all (must be!) ?
Or is there some internal CALAMUS parameter which
she must set ?

Thanks for your time,

Danny

As I understand it, the problem arises because keyboard and mouse
event processing requires enough time that, by the time the
interrupt handler finishes, one (or more?) MIDI bytes may have
come and gone. One solution is to install a new keyboard interrupt
handler that merely stuffs the ACIA data into a queue, to be processed
at a lower priority by, for instance, a VBI routine. I have
successfully done just that, but did not manage to make it compatible
with OS calls (not a problem for my particular application).

> [how to place the mouse at an arbitrary screen x/y]

First ask yourself: Do I really need to do this? Do I really really need to do this? Will I be disorienting the user by jumping the mouse around? Is my need so great that it justifies stepping outside the normal idiom of the system, in which only the user can change the mouse position, by actually moving the mouse?

If you make it through the questions after giving them serious thought, and you still want to hyperspace the mouse, actually doing it is pretty easy:

Just plug the new x/y values into the Line-A data structure's g_cur_x and g_cur_y locations. Do it only when the mouse has been turned off via a graf_mouse() or v_hide_c() call. Do it only when you have wind_update(BEG_MCTRL) in effect, so that you are sure it is your application that has total control of the mouse and you won't be adversely affecting other processes that might be tracking the mouse.

In the seven or eight years I've been programming ST machines, I've come across exactly one situation where I considering programmatically moving the mouse to be justified: In an application that changes screen resolution from whatever you have set to low rez, I note the position of the mouse in the original resolution, then after switching to low rez, I change the mouse x/y so that the mouse appears to stay in the same screen position in the new resolution. That is, if you're in 640x480 rez and the mouse is at 320,240 (ie, centered), then after changing the rez I change the mouse location to 160,100 (still centered in the new rez).

The net effect is that the mouse seems to stay in the same position on the screen during a rez change. This is the *only* time I've been able to justify the action based on all those questions in the first paragraph. Instead of taking control away from the user and possibly disorienting him/her, I considered it to be just the opposite. Having the mouse jump around on a rez change was a bit disconcerting. Forcing it back to the center of the screen wasn't much better (that's what newer TOS versions do on a rez change).

I use the composite and sound outputs to go right into my 8mm VCR.
You must be in either colour resolution.

After I get the sequences I want on the tape, I edit from the
8mm VCR to the VHS VCR. This work sort of OK. I would like to
get a Genlock but that would mean a hacking my ST a little more
than I like.

I dunno about recording in Monochrome (no doubt it can be done, but I'm not sure how). But there is an easy way to videotape a color screen or animation. Use the RF port (the one where you'd hook the STE into a TV set), plug it into the switch box, and plug the SWITCH BOX into the CABLE IN port of the VCR. That way, anything feeding from the STE will go through the VCR before getting to the TV, and thus you can record it.

For even more fun, if you have a stereo VCR, you could connect the STE's stereo RCA jacks to the audio inputs of the VCR, and record it in stereo then...

I sort of did a mix and match once. I plugged my MegaSTE into my VCR with the above hookups, and then plugged my CD player into my VCR's audio inputs. That way, I videotaped myself playing a video game while "Jospehina" (Gene Loves Jezebel) played in the background.

Come to think of it, you can use the above hookups to record an Atari 8-bit, and any other system that you would normally plug into the cable-in port of your TV - just plug it in the VCR and then plug the VCR to the TV, and voila!

Hope this helps...

I would guess that the Falcon is fast enough to obviate the need, but whether or not your software will actually observe this capability is obviously another matter...

MiNT allows the MIDI device handles to be redirected, so yes, you could insert a long pipeline of processes if you wished.

651. 38400 Baud serial port...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-04 19:16:39 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Feb4.191639.14436@prime.mdata.fi>
Source record: 40700

I just tried to solder my STe into having a 38400 bps serial port, but it acts just like normal (it still uses 19200). I did it by cutting the connection between the 68901's pins 10 and 16, and then I soldered a 4040 like this :

4040 68901

7 7
8,11 34
10 18
16 11

The numbers indicate which pins were soldered to which.
As I have never done anything like this before, I don't know how much one has to scratch the platine to make a disconnection, I used a pocket knife and made a visible scratch. I counted the pins on the 68901 by using the pin marked by a small ball as number one (it is in the upper right corner of the MFP when you look from behind the keyboard, at least on my machine).

Any help is greatly apperciated!

652. Atari formats PC better than PC

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-04 19:19:54 UTC
From: mayfiej@ucunix.san.uc.edu
Message-ID: <C1xv16.Kq@ucunix.san.uc.edu>
Source record: 40701
Cross-posted to: comp.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

I do a lot of disk swapping between my ST and my PC. I use a number of different devices and programs to format my disks. Recently, I noticed that different disks seem to read data at different speeds. I knew that the interleave of sectors can affect this but I doubted that this was the case for two reasons: 1.the write speed always seemed to be the same no matter which disk I used, and 2.I have never intentionally formatted a disk with a different interleave the default.
I conducted a simple test comparing the formatting, writing and reading speeds of my different devices. To do this, I took four COMPLETELY blank double density 3.5" disks and recorded how long each device/program took to format a disk with 80 tracks, 9 sectors per track (MS-DOS standard). Next, I recorded how long it took my PC to copy three files that added up to 578,293 bytes (564.74 k) onto each floppy and how long it took to read those files from each floppy.
The devices I used were 1.an Atari 520STfm with 1 meg and DS/DD drive, a Toshiba T5100 laptop PC compatible and a Roland Sound Brush MIDI file player (which formats/writes/reads IBM format disks). I used two different programs to format on the ST: PS2FORM and DCFORMAT v 3.02. I just used standard MS-DOS protocol to format the disk on the Toshiba (FORMAT a: /f:720). The data are as follows:

Device	Program	Format Time	Write Time	Read Time
ST	PS2FORM	1:23	0:49	0:34
ST	DCFORMAT	1:07*	0:48	0:33
PC	MS-DOS	1:35	0:48	0:41
Sound Brush	N/A	1:07	0:48	0:41

* DCFORMAT requires that you write an MS-DOS boot sector to the disk after formatting if you want the disk to be PC compatible. This only takes a moment, however. Plus, you can only write the MS-DOS boot sector to disks formatted in 'normal' mode (not 'skewed').

Interestingly, the PC took the longest time, overall. Although the write/read results were identical for the PC and Sound Brush, the PC took an extra 28 seconds to format! Of the Atari programs, the write/results were very close, however DCFORMAT took less time to format than did PS2FORM. (Of course, then you have to write the MS-DOS boot sector when using DCFORMAT, so the results are a bit closer. You will notice that ALL of the disks performed equally well during writing, but BOTH of the Atari-formatted disks took significantly less time when READING. This is important, since your computer generally reads more stuff than it writes.
I should note that the FORMATTING results would probably have been

different if I had used disks that were already formatted rather than completely blank ones. Usually, it takes less time to format a disk if there's already stuff on it... USUALLY. (If the disk was previously in a very different format from what your computer's used to it can take a lot longer. Sometimes you even have to erase such a disk before your computer will let you format it!)
I do not know why the Atari programs performed better on this test. Perhaps the Atari just defaults to a different step rate, allowing it to read sectors more quickly. There are other Atari programs that will format in MS-DOS mode, but the others I've tried have either been buggy or have performed very innefficiently (when reading a disk formatted in the MS-DOS mode on my ST communications program, it takes longer than it would to FORMAT!) If you know of any others, or of an alternative PC formatting procedure/program I would very much like to know.

Hi John,

I believe this is a "known" problem in the Atari OS... I
spent a LONG time rewriting the interrupt handler for the
level 6 interrupts myself...

Unfortunately I had to wwrite my own mouse and keyboard
and routines (along with MIDI), so it's not compatible
with any of the XBOIS routines.

Also, because of this, I can't use GEM either. SO, I started
writing a Motif-like system, that would allow me to have
buttons, text "widgets", scrollable lists, etc., and I
haven't quie finished it.

What I did in the interrupt handler was to look at the MIDI
byte register FIRST, before mouse and keyboard. This way
it was possible to get 100% data accuracy in MIDI input
functions. I'll have to warn you this is a LOT of work!
I'm currently buried in my full time job, and haven't been
able (or up to) spending much time finishing my Atari work.

Hope this helps,

John

654. Re: Memory Upgrade 1MB -> 4MB

After seeing how close my 1040STF power supply came to frying without any memory extension or cartridge port expansion of any kind, I would be afraid to add 32x1Mbit chips or 4 simms to it without either removing the on-board rams or upgrading the power supply.

Source record: 40703

Me again!

Thanks to everyone that helped me with my resource questions :) :)

but yet, another question...

I've seen it mentioned once in a while that my STe has a special
hardware scrolling operation (as part of the enhancement). Since I
only have manuals that describe TOS and GEM before the STe, does
anyone know the proper call (I'm assuming it's a BIOS or XBIOS routine)
and parameter(s)?

If anyone does I would need information that I could use with C or Basic
(that is, function number, parameter list)

Thanks everyone for all your help!

657. More good news on Atari to format IBM disks

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-04 22:47:59 UTC
From: mayfiej@ucunix.san.uc.edu
Message-ID: <C1y4o0.BAG@ucunix.san.uc.edu>
Source record: 40705
Cross-posted to: comp.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

After posting my findings on the differences between Atari and IBM
formatting procedures, I discovered that disks formatted on the ST with
DCFORMAT 3.02 leave 2k less to the user than disks formatted on the IBM
or with PS2FORM. I was, at first disappointed by this, since DCFORMAT
was the quickest, overall in my original tests and I was thus planning to
register it and make it my official formatting utility- but I didn't want
a formatter that left less free space on the disk than it should.
But then I thought, "Hey, DCFORMAT lets you format up to 82 tracks.
I wonder if that would fly on the PC?" So I tried it, and it worked. To
test whether my PC would handle stuff on the extra 2 tracks, I filled the
disk up with small text files, so that every data block on the disk was
occupied. Not only did it copy without error, but the files, when accessed
loaded just as quickly as the other files on the disk. Here's a list of
the formatters that I tested previously and the amount of free space they
leave on your disk:

Device Software	Free Space (in bytes)	Free Space (in k)
ST DCFORMAT (80 tracks)	728,064	711
ST DCFORMAT (82 tracks)	746,496	729
ST PS2FORM	730,112	713
PC MS-DOS	730,112	713
Sound Brush	N/A	730,112	713

So, DCFORMAT 302 gives you 16,384 bytes (16k) more space on your
disk (if you format 82 tracks, 9 sectors per track [in "normal" mode!])
than if you format the same disk on a PC with the standard 720k format
command.
Now, please note that when you format a 720k disk, you're NOT going
to get 720k free space. See, some of the sectors are reserved for booting
and for the directory. That is why the PC, Sound Bruch and PS2FORM leave
us with 713k instead of 720. Some formatters allow you to change the number
of sectors allocated to the boot table and directory, but I don't encourage
doing that unless it's really necessary; I've had problems on other peoples'
disk drives and computers when I mess around with that stuff.
I am now very impressed with DCFORMAT, and am going be using it for
quite a while. (Unless I find something even better!)

You're using Kermit, I presume.

The problem is very probably that the parity is set incorrectly at one
end or the other (or both :-)).

If you're running C-Kermit under UNIX, you probably want to invoke it
using a command like:

kermit -p e -i -e 300

This means:
-p e
^^^^ Even parity (if you're on a 7 bit line, this is probably
what's messing you up)

-i
^^ - Binary mode (assuming it's binary, and you don't want
file translation)

-e 300
^^^^^^ - Use receive packet length of 300 bytes.
Choose your favorite value.

If the RS-232 setup screen says "even parity", then you need -p e. If
it says "odd parity" (very rare!) you need -p o. Otherwise, the
parameter is not needed at all.

>so, write the fact and then underneath the disproof. I repeat I'm not
>flaming. I just want the facts, whatever side of the line they lie
>on, as I use a PC at work and will be using a Falcon at home (soon).

I can disprove it just by naming the magazine - ST Format. This magazine
is well known for it's inaccuracy. The part of the reply I have quoted is
absolute crap - on the Falcon the 68030 effectively has a 16 bit data bus
like the 386SX.
However, a few points made were correct - a Falcon probably is faster then
a 25MHz 80386SX (even ignoring the DSP), and the subjective difference is
greater when using GEM agaist Windows. The point about the speed of VGA cards
is also valid.

I don't know SL, but in 1.09 you had to load a driver from within Calamus, i.e. in the dialog you get when you select the print command. Before you have done that, the upper part of the dialog box is empty or it says that no driver has been loaded. After you have loaded the driver you see some slm804 settings and may change them.

Anyway, it is not troublefree indeed. I had to get a more recent slm.sys (the old version was sm804.sys) to get it to work, and even then printing a page from calamus has once erased the partition table of my disk!

Why do we talk about the power of pc and falcon? The pc *IS* faster - and maybe cheaper. I don't like the pc, I don't the the ancient MS-DOS and the kidding WINDOWS. I think the OS-structure of MultiTOS will be much better than DOS+WIN#!$. But if I had to spend about $2000 for a good Atari, I've to think about a good PC (not for games!!!!) for about $1000, too.

Any ideas?

As there has been no reply as yet, I'll ask again....

Could any one tell me HOW you turn off the processor instruction cache in a 68030 based atari machine....this is meant to help improve compatibility with things like Llamatron (all praise Jeff Minter).

My machine is a Falcon030, but if any TT owners could tell me how to do it on a TT then perhaps I could manage something on the Falcon. MultiTOS has the option in a pull down menu from the desktop, but the version I've seen doesn't run correctly on a Falcon (it has masses of memory allocation problems & cann't display the desktop).

I would like to upgrade my 1040STe to $M, but am unsure about how fast the SIMM memory modules need to be. Will slower modules slow my machine down, or just crash it, and what is the slowest module I could use without loosing speed? Will four 1Mx9 100nS SIMMs modules do? I've looked in the FAQ, but can't find any of this information. Any help would greatly be appreciated.
Thanks,
Simon.

the signals of the internal driver chips are too weak to
drive all the old RAMs AND 4MB of new ones. You will have
to cut them out.

Regards,
Walter.

I saw these environments available in TeXDraw but I never got them to
work. What does one have to do to get the EEPIC environment to work
with CS-TeX on the Atari-ST? I believe that extra fonts or some interface
to the previewer and printer code is required. Has anyone here do it?

I`ve used TeXDraw very frequently in my papers, and have formatted these
with CS-TeX. There are no extra fonts needed. Just make an "OUTPUT to LaTeX-
Style" and include eepic.sty to the documentstyle-options.
In the document I put following rows:

```
\begin{figure}[htbp]
\leavevmode
\hfuzz51pt
\begin{center}
\input{w_top}
\caption{Oberste Widget-Hierarchie}
\label{abb:w_top}
\end{center}
\end{figure}
```

while w_top.tex was the name of the file TeXDraw generated.

I found it easy to use, like old GemDraw and it is not as buggy in V1.86 like
it was before. I didn't use the more sophisticated functions like
Output to Metafont or so. It did fit my bare essential needs.

You don't give the equipment spec. - to use Calamus with an Atari laser
printer you must have a minimum of 2mb RAM as the image must be built
up in the computers' RAM as Atari haven't put any in the printer! If
you have some other make of laser printer then you will need a printer
driver for that make and model - drivers are around for almost all printers.
The printer driver is loaded from the PRINTER page found by clicking on the
PRINTER item in the first menu. There is a box labled LOAD PRINTER DRIVER
just click on this and you will get the file selector to select the printer
driver for your printer.
Email if you need more help

Yup, you do indeed have to install some driver like SLM804.sys (in the same menu as the different paths). I really cannot remember if you need to have the diablo emulator in your AUTO folder - I think you do. Try it and see if it helps). (Hey, I'm at work here, and my docs are at home ;-)

Not many who seems to KNOW calamus real good her:^) I've seen some strange advices in this thread!

Facts follow:
Calamus uses its own printerdriver for the SLM printers (SLM804.CPD).
The driver is loaded from within the PRINT dialog.
The driver adresses the hardware (printerport) directly and does NOT need anny resident driver loaded at boot-time.

There is howewer a epson emulator for the SLM printers called LASERBRAIN. This emulator was made by DMC years ago. It is loaded at boot time, and stays resident. This driver CAN be used from Calamus, but this one ALSO need a special driver (LASBRAIN.CPD i think it was called) loaded from the PRINT dialog in Calamus. I hav not tried this myself, but I've had reports that this last aproach gives faster printouts in Calamus (at least on MST(E)s) than using the SLM804.CPD!

On my pre-production Falcon, the General Setup CPX had a Chip Select section that let you turn cache and blitter on or off. But I seen on the more recent machine (TOS 4.01) that CPX is missing the Chip Select stuff.

I can post a short bit of assembler code that'll do the trick, if you can use that.

>
>- Leo
The 68030 itself has a 32bit data bus, but that doesn't mean the Falcon has,
as Leo quite rightly says above. One point in the Falcon's favour here
however is the read ahead instruction cache which should mean that although
it takes two clock cycles to read in 32bit data, this can be done _while_
the processor is busy on the previous few instructions as with the 68020.
The '030 would normally be better at this than the '020 because it can
burst mode read in the instruction. Sadly, if the Falcon has a 16bit data bus
then it certainly doesn't have burst mode(aka Page mode) RAM.

TOS upgrades...I've heard of those! Mind you, I have no proof that they
actually exist.

You see, I've been trying to upgrade my TT to 3.06/1.44fd for, oh, about 5
months now, with little success. The local dealer I've been dealing with still
hasn't managed to find a supplier that has the damned thing in stock.

Sorry about the flaming, but I'm just a teensy bit annoyed about the
whole thing.

P.S.: Isn't sending dumps of TOS binaries to other people kind of, well,
you know, illegal?

This procedure is the same in SL. In fact, you can use 1.09 drivers in SL.

To the poster of the original message, how is the laser printer (an SLM I assume) connected? Is it daisy-chained at all? Are you sure you have enough memory? The computer needs at least 4megs to do anything useful on an SLM laser printer.

(Wow, that's one long line.)

The slowest SIMMs you can use are 150ns. 70s, 80s, and 100s are the most common and you can use any of them (of the same speed) in your STE.

Yes, 100ns 1megx9 will work fine.

684. Re: AutoSwitch Overscan/Spectre-(Q)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-06 04:30:40 UTC
From: dsmall@well.sf.ca.us
Message-ID: <C20F74.7Cy@well.sf.ca.us>
Source record: 40738

I've long, long, long looked into making AutoSwitch Overscan work on Spectre. That is one slick package and a very clever idea.

In the newsletter you reference, at the time I wrote it, I believed I had a way to make
AO work with Spectre. I was wrong. It happens. It just plain did not work. The difference was
the implementation on a color monitor vs. monochrome; as you probably know, in mono, the
border is artificially generated by AO.

This gives the Mac absolute fits, because it *insists* it is running on a Mac, with continuous
screen memory -- e.g., the last byte of the first line is right next to the first byte of
line two. In AO, there are extra "black bar" bytes to force a border to exist, and it spazzes
out Quickdraw. I have never found a solution, although I have tried the obvious ones:

1. Tell Quickdraw I have a bigger screen. No luck, it erases the black bars, and monitor sync
goes *tweeep*

2. Artifically copy the real screen to the AO screen. Possible, 50% degradation in performance.
Lynch mobs. Ropes. Torches. Trees. Slowly twisting in the wind.

3. Wave a dead chicken at it.

I'm totally croggled. I would *love* to get AO and Crazy Dots working on Spectre. I don't know
how. Probably out there someone has the clever idea I need to make it work -- but Apple didn't
invent *device independent* screen drivers until the ROMs on the NuBUS cards for the Mac II.
[Now, how would I know that?].

Oh, PLEASE don't start a mailing campaign to try to get me to do this. I've got a to-do list
that would horrify Hercules and the Aegean stables called Spectre 3.1 that I'm trying really
hard to get "out the door" for TT people with SCSI drives. It'll just slow me down.

In the tech world, some things can't be made so by repeated requests or demonstrations.

Thank heavens I am not in politics. (Well, I sort of am, being on a Net...)

685. Re: Can Spectre parallel output -> serial?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-06 04:45:20 UTC
From: dsmall@well.sf.ca.us
Message-ID: <C20FvL.7pt@well.sf.ca.us>
Source record: 40739

The referenced note talks about Spectre parallel vs. serial.

It's a really keep-it-simple-stupid implementation, to be honest with you. When a byte
comes winging my way from what the Mac book cheerfully calls the printer, I check a flag
that is set by Spectre's front menu. If it says "divert to parallel", I do it, strobing
the byte through the printer. It is a known fact about Spectre that it is NOT fast printing
parallel compared to programs that optimize the printer port, but on the other hand, I haven't
got a speed-demon operating system handing me bytes, either! If the flag is not set, I shoot
the byte into the 68901 MFP at whatever baud rate it's set up for. (Of course, I don't overrun).
There is now some CTS/RTS and XON/XOFF checking code in there, as of Spectre 3.0, but the
whole concept terrifies me so I hold up garlic whenever I bring up SERIAL30.S on the CRT.

Oh, yes. We also check if you diverted output to the laser printer driver emulator. I forgot
that.

As for input, well, you'll have to do some bit-banging on the Yamaha chip to reprogram it for
input. I'd be particularly grateful if you wouldn't hand Spectre an interrupt it doesn't
have any idea what to do with; the Mac printer drivers *are* serial devices, but they're
funny; there's a serial "device" that's output-only, a serial "device" that's input-only,
for both serial ports. Don't ask me, I didn't design it. Anyway, IF you open the proper SERD
driver, you could *probably* use the JIOxxx vectors to circular buffer data winging in from
a printer port you've reprogrammed.

Please be nice and reprogram the Yamaha chip before you give control back to Spectre.

On serial input, I have a 512 byte circular buffer on the input interrupt. This is strictly
because I *hate* serial overruns, especially during modeming, and that makes it far less

likely. The program is pretty lame if it can't manage with that big a front-end.

Feel free to email me at dsmall@well.sf.ca.us for more info, or DAVESMALL at the Genie hookup,
or 76004,2136 at the Compuserve hookup. This sounds sorta neat.

You will have to be terribly careful on interrupts. The Mac sits at IPL 0, we sit at 3 or 6
depending on 60/70 Hz VBL selection. The MFP arbitrates level 6 interrupts and you could get
into some real fun there. I'll help you all I can.

686. Re: Disabling 68030 Processor cache...?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-06 05:04:58 UTC
From: dsmall@well.sf.ca.us
Message-ID: <C20GsA.871@well.sf.ca.us>
Source record: 40740

First, be sure you want to clobber the caches. They are responsible for a lot of the
Falcon030's speed. Llamatron might end up real slow.

You want to call your local Motorola office and ask for a 68030 reference manual. They
live to give them away. Otherwise you can get into trouble with this.

You basically want to whap two bits in the CACR, the cache control register. I believe
you want to put a $0808 into it, but I've been looking at Spectre 3.1 code for so long
I may well have forgotten.

Okay, the CACR, which you must do a MOVEC (not a regular MOVE, it's supervisor and 68030
ONLY) into, will turn off the instruction and data caches, plus clear them, if you ram
a $0808 into them. To switch them back on, try a $03111; that will enable the caches, and
click on data and instruction "burst mode enable", which is a slick, fast way to fill them,
which the Falcon doesn't use. Don't want burst mode? Use $0101. The low 4 bits are instruction
cache; the next 4 are instruction burst and not-used, the 8th position nybble is data cache,
and the 12th position nybble is data burst and write allocate.

You MUST do this in supervisor mode, and your Falcon is going to be
hurting when you do it.
There is a darn good reason Atari removed the Blitter enable and the Cache enable...
the Falcon is highly tuned to rely on them.

[Hi, Ian! Hey, Denver is really the center of Falcon development, hunh?]

-- thanks, Dave Small / Gadgets

p.s. Please get the 68030 data book. It will be free from Motorola if you tell them you are
looking into new processors for a project. You need to know the cache stuff to be doing this.

p.p.s. Take my word for it. Do a PFLUSHA after you dump the caches. I know, I know, you're not
supposed to have to -- but the SST stopped having conniption fits when I adopted the habits.

I theeeenk the caches are still looked at even when technically disabled.

I asked the very same question (I may not have noted the fact that the
code was 65503, but I think that was roughly the number I got) a
couple of weeks ago; the sundry replies led me to the following "fix":

In the makefile, make sure you compile WITHOUT the option -DMULTITOS.
Comment out/remove -DMULTITOS, and it should work fine. It will work
as MiNT, instead of MultiTOS, but the only differences are:

a) The messages displayed
and

b) If you are not actually running on a Falcon, or some machine with
MultiAES, the loading of \AUTO files and the likes gets done by TOS.
On Falcon (and the likes), MultiTOS is used to moderate the loading of
programs in the \AUTO folder.

The "crash" takes place when it tries to load C:\MULTITOS\GEM.SYS,
which I think is supposed to contain MultiAES.

I'm not sure about all of these details; they're vaguely educated
guesses, based on a cursory look at the source code. I expect someone
else could explain the "crash" better.

At any rate, take out -DMULTITOS from the Makefile, and it should work
great!

Oi! relax a little, Ian!

MTos isn't really all that bad - and the number of people I've talked to (both professionals and lay-users) about it, shown bits of it to, have generally agreed that it's no more complex, and in many ways simpler than, say OS/2 or windows...

Why mess with these machines? Because they're _fun_.

Other architectures amy offer 'more' of everything else, but they lack the element of real fun I have with the TT.

Oh, and so far I haven't had to ditch _anything_ for its unusability under MiNT...

> cap by opening up the monitor and examining the circuit board.
> Look for caps that have brown goo leaking from them. These should
> be replaced.

Thanks for the tip, Brett. I had assumed that I had a broken trace,
which needed to warm up in order to get a picture. The bad cap
explanation is a lot more logical.

I have a 1987 vintage SM124 which has been used for many long sessions,
initially standing flat on the table, which could have reduced
ventilation.

It turned out that NINE of my caps had leaked goo: C402, C403, C610,
C714, C715, C716, C717, C718 and C909. I have identified eight of them,
but cannot positively identify C714 marked 2.2uF 50V (BP). Am I right
in assuming that this is a bipolar capacitor? I cannot seem to find such
a value in the local well-assorted electronic shop's catalogue.

Thanks for any help
/Mike (looking forward to returning to the sharpness of an SM124 from a
colour monitor any day now.)

691. Problem with MINT .99?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-06 15:07:33 UTC
From: tevans@cs.utah.edu
Message-ID: <1993Feb6.080733.3283@hellgate.utah.edu>
Source record: 40645

I recently got Mint .99 to compile on my Mega2ST w/ 4 Megs of Ram, but for some reason when I start up a shell (ksh and others) it doesn't seem to recoginze my environment variables. If I set up my PATH in my ksh startup scripts it doesn't recognize them for some reason. I can set them however after ksh is started up. The variables worked and still work as normal with the .96 binary.

Has anybody else expreienced this problem? If so, any suggestions? Maybe some kind soul could upload the .99 binary for a non-multios OS system to a.a.u.e so alot of us wouldn't spend hours waiting for it to compile.

Thanks,

tevans@cs.utah.edu

Hi everyone,

How can I _periodically_ read the system variables in supervisor-only
memory without hogging the CPU?
If I switch to supervisor mode all the time, multitasking won't go well at
all, so what are the other solutions that'll keep working OK with MultiTOS?

Ta!
Vincent

As near as I can tell, this is a .tech discussion.

If we can't discuss CPU caches, burst-mode bus accesses, number of CPU cycles required to access main memory, and other such subjects here, then what exactly DOES qualify as technical in your mind?

695. Can ICD really be that BAD?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-06 22:46:46 UTC
From: lehmann@cs.tamu.edu
Message-ID: <1l1f4mlNN85u@tamsun.tamu.edu>
Source record: 40649

I've had a 127Mg Quatun ELS drive for a month now. I purchased it in a hard drive case with an ICD AdSCSI Plus ST card and power supply.

The drive worked without error for quite a while.

I formatted the disk and partioned it to my liking.

Then I took my failing 60Mg hard drive out of the Supra Case, gutted the drive down to its adaptec adapter and Control Data drive. I place the drive in the 5.25" empty expansion bay of the hard drive case, connected the spare SCSI cable to the Adaptec card and I connected the spare power supply cables to both the Adapter card and to the Control Data 60 Mbyte hard drive. I then placed a thin wire around the jumper pins that identify the Quantun ELS 127 drive as SCSI ID#1. Last I removed the terminating resistor from the Quantum ELS 127 Drive. The result was two functioning hard drives.

I had been getting <Sense $11> and <Sense $13> codes from my drives.

According to the AdSCSI ST Series manual, a SCSI <Sense $11> means "Unrecovered read error of data blocks." It further says "The operation was terminated with an unrecovered error condition probably caused by a flaw in the medium. This indicates that there is a problem, probably a bad sector. You should run a program such as Cleanup ST tocheck for and map out bad sectors.

"If this message appears while you are running Cleanup ST but no errors are reported by the program, then there are probably bad sectors that have already been mapped out. Similarly, any program that reads sectors without checking to see which are marked bad in the FAT may cause this message to appear, although there is no problem.

"If new bad sectors begin to appear and it becomes necessary to map them out often, there is probaby a problem with the hard drive mechanism."

And <Sense $13> says "No address mark found in data field"

I didn't know what caused this. Then I decided to get mean and do an intense bad sector mapping. I typed the bad sector map data that was printed on the Control Data drive into the ICD format program (ICDFMT.PRG). Then I realized that the drive had always been formarted as a TANDON 755 drive which was wrong. I chose the appropriate Control Data Drive type (seceral digits followed by a 51M) and formatted the drive along with a good bad sector map. The Controll Data drive has never again given me a <Sense $11> or a <Sense $13>. But the brand new under two year warranty Quantum ELS 127 still gives me <Sense $11> and <Sense $13>.

I purchased CleanUP ST! and ran a bad sector map in both BIOS/FAT and SCSI/SCSI mode with 50 re-reads on each sector. CleanUP ST! can't find a bad secter. But I get a <Sense $11> and a <Sense $13> when I run CleanUP ST!. The drive did not come with a bad sector map and I cannot chose any drive types when I format that drive.

So what are your suggestions? Could the Control Data be eating up too much signal and causing data transfer between the Quantum ELS 127 drive and the computer to be damaged? Whenever I do large data transfers or hundreds of files to the last partition on the Quantum ELS 127 drive, I also get a TOS error indicating that Data on the Drive is damaged. This is in addition to the <Sense $11> and <Sense $13> codes. It is quite annoying.

How is ksh looking for its startup file? Have you remembered to set
the "HOME" environment variable in your mint.cnf file? If so, and
if it's still not working, make sure that you remove the -DMULTITOS
line in the makefile and recompile it.

>
>Maybe some kind soul could upload the .99 binary for a non-multios

Please read the file "copying" that was included with the source code.
Distribution of binaries is not permitted (for a variety of reasons
that I've mentioned before). Please respect this condition; otherwise,
it is unlikely that free versions of MiNT will continue to be
made available.

Eric

698. TT cache vs. pagestream printing

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-07 03:39:03 UTC
From: fsctc@avelon.lerc.nasa.gov
Message-ID: <1993Feb7.033903.28849@eagle.lerc.nasa.gov>
Source record: 40652

I just hooked up our new HP Laserjet 3P to use in our office. Previously, we've been using a HP Deskjet +. Since both unit suse HP's control language, we thought it was going to be an uneventful process. Well, almost.

Okay, first the setup. I've got a TT w/ 4 MB ST RAM and 16 MB TT RAM on a GE Soft board. I normally run the TT with the cache turned on.

The printer is hooked up through the TT's printer port, routed thorugh an automatic switcher, and then into the LJ3P's parallel port.

ASCII text dump works fine. Screen dump with a Deskjet driver installed also works fine. GDOS printing works fine through Easydraw, and Opus. However, when I go to print with Pagestream 2.2 using the included Laserjet driver, gibberish comes out and pages and pages gets ejected. It doesn't matter what print density I use. When the TT's cache is turned off, it works like old times. I tried configuring the program to run from both the TT RAM as well as the ST RAM. It didn't make any difference.

Any care to take a stab at the problem and the solution?

Clarence

ps. The same printer is shared (through the auto-switch) with a Gateway 2000 i486 machine and an Apple IIe. They don't seem to be affected.

From: evanlang@sdf.lonestar.org
Message-ID: <C22CI6.5F7@sdf.lonestar.org>
Source record: 40653

I would like to create a sound driver for MiNT so that my own programs can access the driver instead of the STE sound hardware. Hopefully I can make the driver "mix" sound data from different applications stopping the annoying problems when 2 programs try and use the same sound hardware at once.

What I need is documentation on the sound hardware. Does anyone know what memory locations to set and with what data? I have no idea how to make the sound, control the GIA mix, the bass/treble, etc. If anyone can post this info, please do, Thank You MUCH!

700. Program Registration Keys (How do I incorporate this?)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-07 10:36:38 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.YUa&eI3HbgQ@elfhaven.ersys.edmonton.ab.ca>
Source record: 40654
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

There is an interesting method of releasing Shareware programs that seems to be growing in popularity. The program is released with all functions intact, but key functions locked out unless the user enters a "key". CoNnect is a program that does this, as does MasterCache.

How is this done, though? I would like to use this method of releasing programs (faster for the user, cheaper for me).

How do I generate the key (based on the name of the user)?

Lastly, I would like to know what people think of this method of releasing software (which is why I crossposted to comp.sys.atari.st). Do you like it?

701. 38400 Baud problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-07 12:10:52 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Feb7.121052.3612@prime.mdata.fi>
Source record: 40655

Now I got the 38400 bps serial port working, to some extent. I downloaded a textfile at just over 3000 CPS, but I still couldn't upload the same file at more than approx. 1920 CPS, seems like only the download is working at 38400. Moreover, characters disappear every once in a while, with Uniterm and FreeZe Dried Terminal, but with Miniterm this doesn't happen (It is in ACC "mode", would that have any effect?). So it seems that the machine isn't able to fetch all the data at the same rate it arrives. I have tried many flowcontrol patches, but none of them would help the situation. In FreeZe Dried I can't even download anything, as soon as the XYZ's Zmodem screen displays, it begins filling up with CRC errors (I have an error correcting modem), and occasionally maybe a few blocks get through. From the desktop I am able to download at high speeds, though. Any help on my problems would be _greatly_ apperciated.

It can't be that the driver accesses the printer port. The Atari
Laser printers are hooked up to the computer via ACSI.

IMHO, this is _the_ most annoying thing any programmer can do in a
program. Well, maybe not _the_ most annoying thing, but it certainly
bugs me. It seems to suggest that the user is too unco-ordinated to
actually _move_ the mouse to the next button/whatever on their own.

The other Most Annoying Thing is writing a GEM-ized program using the
VDI instead of the AES. GER2ENG v 1.9 managed to do this in such a way
that it crashes wickedly if Warp-9 is installed. Not to mention the
fact that it does unpredictable things on screen. Since a newer version
hasn't shown up on GEnie or atari.archive yet, I haven't been able to
see if version 2.? fixed these little problems.

I think you can mix speeds, but it's not recommend as it might cause
problems down the road.

> how to read system variables periodically

What do you mean by periodically? If there are a few variables that you need to see relatively often, you could install a VBI routine that copies the variables from the OS area to your data area on every vblank. Since the VBI handler gets control in supervisor mode, there's no extra overhead for switching modes.

If you need to know the up-to-the-instant value (ie, the values from the last vblank may not be timely enough), and you'll be doing it often and performance is a factor, you can grab an unused trap vector and install your own function to access the variables. Then to get the variable(s) you'd just do, say, TRAP #15, and your handler would retrieve the variables and return them, or stuff them in your local data area.

(I've been wondering lately if there's any standard for finding and grabbing an unused trap vector for this sort of thing. I've been wanting to do exactly that myself, but I don't know if there's a way to avoid stepping on other programs that are doing the same sort of thing.)

Special Edition Friday Night Conference
GEnie ST RoundTable

Dateline Atari! with Bob Brodie
Host - Lou Rocha

February 5, 1993

<[Lou] ST.LOU> Welcome to another session of Dateline Atari! with Bob Brodie. Let me begin by thanking Bob and his colleagues at Atari (Bill Rehbock, John Towns, Greg LaBrec, Dan McNamee) for their online support of GEnie members. Their participation has been most helpful to all and has certainly raised the excitement level in the ST Round Table.

Since we last met Bob, there has been increasing information about new software to be bundled with the Falcon030. We have also heard about MultiTOS, SpeedoGDOS and that great new integrated application, Atari Works <originally named ST Sutra, then Concierge>.

Bob, I have really been looking forward to tonight's RTC. I think the transcript for this one may set a new record for downloads surpassing even your last meeting with us. So let's get this show on the road with your opening comments. GA

<BOB-BRODIE> I'd like to welcome every one to our February installment of Dateline Atari! I hope that all of you are enjoying these conferences as much as I am. I'm pleased with the opportunity to interact with each of you, and share with you all the latest events in the Atari Community.

Tonight, I want to start things off by discussing the current status of the Atari Falcon030, and then we'll talk about our integrated package, Atari Works.

At our last session of Dateline Atari, I told you about the delay in the shipments of the Atari Falcon030 to North America. The reason for the delay was unacceptable performance from one of the contracted manufacturers that Atari is dealing with. At that time, I also indicated to you that we would be bringing on another firm to supply us with Atari Falcon030s, as well as attempting to resolve the quality concerns with the units at the original manufacturing site. I'm pleased to report that the new factory has come on-line in the speedy fashion that we anticipated that they would. We have seen the first runs off of that line, and the quality is dramatically better than the original units. A recent run tested out at less an 0.5% defect rate, which is thrilling news to me! This means that our projections last month that Falcons would be available in North America in March is right on target! We _WILL_ to have the machines in stock in March!!

The added plus of this delay is that we have completed MultiTOS, and all of the machines in North America will ship with MultiTOS! There will be no customers that will purchase Atari Falcon030s that will have to be "retrofitted" with MultiTOS! While we are still debating internally how we want to distribute MultiTOS to the established user base, I'm very pleased that it is _done_. In addition to the inclusion of MultiTOS, we will be finalizing Atari Works as well, and hope to have that available as well to ship with each Atari Falcon030, along with SpeedoGDOS.

Let's talk about Atari Works at this point, and try to give you a glimpse of what is coming with that product. Atari Works is a fully integrated word processor, database, and spreadsheet. It's intended to provide the average user just about anything that they might require in a package to be used in either the home, or for a small business/home office scenario. Most of our energies with Atari Works have been focused on the word processor component of Works, as we believe that word processing is still the most common usage for home users. The Atari Works word processor offers multiple documents, full cut and paste between documents and the other portions of Works, easy set up of justification (left, right, center, or proportional), and importing of GEM metafile images. Atari Works has full SpeedoGDOS support, which means multiple scalable outline fonts with multiple sizes, and your usual bold, italics, underline, outline, superscript, subscript, footnotes, and headers. Works uses the Proximity dictionary system, and updated version of the system that was used with Word Up and Word Flair II. There is also a thesaurus included with Works. Works has full search and replace capabilities, again easily activated by drop down menus.

One of the features that I really enjoy in using Atari Works is the exceptionally easy mail merge capabilities with Atari Works database module. It's always been something of a pain for me to have to mail merge. It seemed to me that there was never really a system that felt very intuitive to me for mail merging. With Works, there is a drop down menu called "Begin Merge" that allows you to begin the process. It's TERRIFIC!!! On the editing side of the coin, Works allows you to transpose letters that just need to be flip-flopped with a Control-T command. Its also "intelligent" about it's editing, in that if you begin moving around text, Works will recognize the need for additional spaces and automatically insert the spaces for you. There are also commands that will allow you to do a number of different text commands, like setting areas to all caps, or all lower case, and other text handling.

The word processor of Atari Works also supports the importation of standard ASCII text, the Microsoft Rich Text Format (RTF) files. This is an increasingly popular format used with PC and Mac word processors, like Microsoft Word. The logical extension of that is that your documents at work can be saved out as .RTF files, and readily brought into Atari Works with the formatting fully intact!!

The database portion of Atari Works will import .DBF files, tab delimited ASCII, and comma delimited ASCII. The Atari Works database is a breeze to set up and work with, too! If you start a new database file, the system begins prompting you for field names, until you tell it you're done. Once the fields are entered, you simply click on the fields and hold down the mouse button while you drag the field to the desired size! Simple, eh? You can add additional fields later by simply clicking on the database form with your mouse. Fields are moved about the page simply by clicking and dragging them. You can display the records in a form fashion, or in a list fashion that looks very spreadsheet-ish to me. :) Since everything in Atari Works is fully GEM compliant, you can also highlight portions of the database records, and save out the area as a GEM metafile and drop it into your document! Of course, this also applies to the spreadsheet as well. That makes displaying graphs and tables as part of your document easier than it's ever been before.

Bill Rehbock, the product manager for Atari Works, tells me that the database portion of Works will feel very familiar to anyone that has ever used a database on a Mac. My sentiment was that I didn't find an overpowering need to run to the docs just to get things going, the database has a very comfortable "feel" to it. I'm not generally comfortable with ANY database, so I have great confidence that most of you will really enjoy the database portion of Atari Works.

The spreadsheet portion of Atari Works is Excel command compatible. Our intention with the spreadsheet is not to compete

against stand alone products like LDW Power, but to provide a good, basic speadsheet for users to be able to chart, graph, and track their finances. We have some portions of our business presently tracking their finances under the spreadsheet of Atari Works.

I could go on a little bit longer about the spreadsheet, but I think I've gone on about as long as I dare on this opening. Let's see what kind of questions are out there, Lou!

<[Lou] ST.LOU> Bob, this is terrific news. Thank you for preparing these opening comments. Since we have so many new users with us tonight, could I please ask everyone to use the /nam (your name) command before you /rai your hands. Our first question is from Bob Frazier of the Kansas City Atari group. Go ahead Bob.

<[kcac-prez] B.FRAZIER2> Bob....I need to know if you found a firm date for the Kansas City Atari Fest..We are at a standstill

<BOB-BRODIE> Hi Bob, I spoke with Garry Tramiel today, and don't have a yes or no about our attending CES in June yet. The possibility exists that we might still have a booth at that show to launch the new Atari Jaguar Game Console. We'll pick this up in email later on, with Dorothy Brumleve. I also got a fax from the CT. Show folk, and they are looking at a June Show Date as well. I'm very happy that we have you online now here on GEnie, as it is making our planning for what is shaping up to be an EXTRAORDINARILY busy show summer much easier. I know that the gang from San Antonio, Indy, and Asheville also very much appreciate the cooperative spirit that you have shown. ga

<[Lou] ST.LOU> Bob... do you have any questions about the Falcon or Atari Works? You may have a followup.

<[kcac-prez] B.FRAZIER2> No....I just needed to know about the show date...Thanks...

<[Lou] ST.LOU> OK... our next question comes from JCD at New Dimensions.

<[JCD] NEWDIMENSION> Hi Bob. The upcoming Atari products are excellent as ususal, but are we really going to see an major increase in Atari's market share in the computer industry? Will Atari _finally_ understand that a national advertising campaign is desparately needed. It seems more advertising dollars are put toward the Lynx than the computer line. GA

<BOB-BRODIE> Hello, Jeff. Nice to see you again online tonight. As I have indicated in previous conferences, Atari has the confidence that this machine will be a tremendous success. Sam Tramiel indicated back in August of last year that Atari didn't have the same confidence in the Mega STE/TT030 line as a major success in the US, due to the pricing/features/performance

constraints. In short it's not a question of Atari finally understanding that they need a national advertising campaign, it's a question of Atari having the faith in a product that can be a national success. The Lynx is clearly a technically superior product to the other handhelds in the marketplace, which explains the advertising support that the Lynx has enjoyed. The Atari Falcon030 is also a product that represents a major technical advancement over the existing CPUs in the marketplace. As a new dealer, I'm sure that you can also understand the importance of not just having a product that you are a fan of, but a product that the public can see a real value in for them to buy. I know that you'll also be pleased to hear that the number of dealer inquiries since the article in BYTE have skyrocketed. You'll probably not be the only Atari dealer in your area for very long. ga

<[Lou] ST.LOU> JCD... there is quite a lineup of questioners. Please hold your additional question for now and /RAI again. Thanks. Next is Joe Torres.

<[STimpy!] J.TORRES17> I have a three part question on ATARI WORKS (YEAH!): 1)Does it support graphics (lite DTP)? 2) What resolutions will it support (falcon only?)? 3)Is it too early for price/availabilty for existing STe Users? GA

<BOB-BRODIE> Hiya, STimpy, it supports GEM metafiles in the word processor which are readily available both online here, and in packages from people like Migraph's Easy Draw. Atari Works will function in any mode that supports 80 columns, which of course includes ST Medium resolution. Pricing is still under discussion, but will include a bundling of SpeedoGDOS and about 14 BitStream fonts in the package. It will be competitive with other verions of WORKS that are already in the marketplace on other platforms. ga

<[Lou] ST.LOU> Bob... John Cole from Lexicor is our next guest. GA John...

<[Lexicor] J.COLE18> Bob, just got the latest version today, fast and great. My first bug report is that I just looked up the plural for 'spelling' and it's 'spelling' not 'spellings' as in the menu bar :-) Fantastic program and I cant wait for it and Falcon. GA

<BOB-BRODIE> John, glad to hear that you like it. The bug is probably related to the Indian roots of our programmer, Pradip Fatepuria. ga

<[Lou] ST.LOU> Thanks John. Next is Eric Nickolaise.

<E.NIKOLAISE2> Hi Bob! What is Atari doing to get Developer Support for the Jaguar game system?

<BOB-BRODIE> Hi Eric, most of that information is covered by non-disclosure at this point. I can tell you that we have development units out, to a number of very talented software houses now. We've

also had at least two developer conferences for Jaguar, one here and one in the UK. Both of them have been greeted with a great amount of enthusiasm by the developers and their publishers. ga

<[Lou] ST.LOU> Scott Lapham has our next question, Bob. GA Scott.

<[Scott L.] S.LAPHAM1> Bob. at the beginning of the conference, you said that the quality of the Falcons coming off the "new" line are much better than before. My question is are any of those units off the first line going to be sold? And if so, how would one tell if you bought a Falcon if it was off the first line or second? GA

<BOB-BRODIE> Scott, the units *_have_* been sold. They are already out the door in Germany. As long as you don't try to mail order one from Deutchland, you shouldn't have to worry about. it. ga

<[Lou] ST.LOU> Thanks Scott. Next is Robb Albright.

<[Robb] R.ALBRIGHT7> Bob, I hear that the deal with Ingram Micro (Distributor) has been tabled, and that Atari plans direct marketing for the first push for Falcon. Are there any deals set with larger chains to carry the Falcon, or any planned, and if not, what will be the way that thousands can get their hands on one?? ga

<BOB-BRODIE> Gee, Robb. That's new to me. Might I enquire what your source is for that information?

<[Robb] R.ALBRIGHT7> A local developer said he got this from Bill Rehbock about a month ago. ga

<BOB-BRODIE> Well, Robb, Thanks for bringing this rumor to the light of day. I appreciate the opportunity to dispel this type of disinformation at the earliest possible time. We have a number of different arrangements working for Falcon distribution, and I'm confident that the thousands of people that want to have Atari Falcon030s will be able to get them. Regardless of what you're un-named local developer might have suggested to you. <grin> ga

<[Lou] ST.LOU> Thanks for clarifying that Bob. Next we have I.DUCKETT... welcome.

<[Evil E] I.DUCKETT.> How will the release of the Falcon help, The STE user? GA

<BOB-BRODIE> I see why your nickname is Evil. <grin> How did the release of the Quadra help the Mac? How did the release of the 486 help the 386? The answer to that is it gives the STE user a higher quality machine to upgrade to that retains a high degree of software compatibility that protects your investment in software. Does it mean that the STE is obsolete? No. It does mean that you can upgrade to a newer, more powerful machine and not have to lose your investment in Atari and Atari related products. ga

<[Lou] ST.LOU> Good answer Bob. BTW folks... I have been using Atari Works on my ST and STE... runs great. Next we have Steve Miller. GA Steve..

<[Steve] S.MILLER58> Hi, I am a somewhat digruntled TT owner who has been an atari owner aince the ole 400 and this my question where is the TT going to be when the Falcon _finally_ makes its appearance? Is the 68030 going to be supported on both systems or will the TT be a fluke machine here in the US sticking me with $6000 worth of unsup. hardware? and if the TT is going to be 'supported' when is the software going to be there to take advantage of he 68030 and the math co??????

<BOB-BRODIE> The TT030 will continue to be a high end, powerful workstation even when the Falcon030 makes it's appearance NEXT MONTH here in the US. The 68030 will continue to be support on both systems. There are products already that take advantage of the 68030 and the FPU, like DynaCadd, all Lexicor products, and Calamus SL. In addition to those products, there are other things like PageStream and Touch Up that are very happy on a TT030, especially when they have a graphics card installed in it, like an AlberTT card, a Crazy Dots board, or a Matrix card. I've also seen an goodly number of Musicians that are happy with their TT030s, and development tools like Lattice C 5.5 that have 030 libraries and FPU libraries. ga

<[Lou] ST.LOU> Thank you Steve. T.WILSON is next, Bob.

<[Dark.Oak.Sof] T.WILSON14> Are we going to see more guidelines from Atari on building apps for MultiTOS? I'm writing a multi-tos Zmodem program and was wondering if I should make it with GDOS, clipboard support, or would a simple .ttp CLI-callable be ok?

<BOB-BRODIE> Are you a registered developer, Tim? Our last developer newsletter had an article on user interface guidelines.

<[Dark.Oak.Sof] T.WILSON14> I can't afford it at the moment, I'm using net knowledge.

<BOB-BRODIE> Net knowledge is a little too far from the source, and I urge you to register as a developer at the earliest possible time. We provide a good deal of documentation to the developers as a portion of the MultiTOS distribution packet. Right now, that is only available to registered developers, and most of the support is done online, in our Atari.RSC area here on GEnie. ga

<[Lou] ST.LOU> Mike McFee from Pittsburg, California is next Bob.

<M.MCFEE> BOB when will MultiTOS be out for the TT if at all?

<BOB-BRODIE> Hi Mike, it will be released for all Atari Computers, as I THINK I indicated in my last conference. :) As I indicated in my opening remarks tonight, we're still having discussions regarding the distribution method to be used with MultiTOS. I

remain a staunch proponent of the "upload it and let nature take it's course" stance, but cannot guarantee that we'll be doing that. The product is done, we just have decisions to make now. ga

<[Lou] ST.LOU> I have a little surprise for everyone... we have a free one year subscription to EXPLORER to give away. Then Scott Lapham will have the next question. Here goes a roll of the dice....

<[Lou] ST.LOU> Job 24... you win! Dorothy!!!!

<BOB-BRODIE> It's not a fix, I swear it is not a rigged deal you guys!!!!

<[Lou] ST.LOU> Dorothy is the winner! Dot... any words? ;-)

<D.A.BRUMLEVE> Thank you, thank you! Maybe this subscription will actually arrive at my door! My other one hasn't. ;-) And I've been so interested to see how the new staff is coming! So thank you very, very much!

<[Lou] ST.LOU> Next we have Scott Lapham....

<[Scott L.] S.LAPHAM1> Bob, have you heard any new news on any products that will allow the SLM lasers to work on the Falcon?? GA

<[Lou] ST.LOU> Bob says he has another subscription to give away folks. Right after this answer.

<BOB-BRODIE> Scott, sorry for the delay, was sending. :) Yes, I have. There is a company that is working on this product, and we have discussions scheduled with them this next week to ensure that it WILL BE DONE, and users of SLM series laser printers will be able to use it with the Atari Falcon030. ga

<[Lou] ST.LOU> OK... here goes another roll of the dice.... Job 15... Chuck Haines is the winner of a free one year subscription to Explorer! Congratulations. Any comments Chuck?

Chuck is speechless!

<E.NIKOLAISE2> Does anyone (if so who?) make a VME RAM board that can be used with the Mega STE? Thanks! GA

<[Lou] ST.LOU> Folks, there are only two in the queue. This is a good time to /raise if you have a question.

<BOB-BRODIE> Erik, I'm not aware of any such ram board. I've heard that they do exist on the VME bus, but don't think that the software exists to make our system aware of the ram once such a board has been installed. ga

<[Lou] ST.LOU> Next is Robb Albright.

<[Robb] R.ALBRIGHT7> Bob, any announcements of terrific, *BLOW-EM-AWAY*, mind boggling games that will be released for the Falcon.

Either planned or set-in stone. ga

<BOB-BRODIE> Robb, there are about 35 games that are being developed for... the Atari Falcon030. Most of them are better than anything... that I have seen on any other computer game anywhere. And for that matter, better than most of the console games, too. We covered that in an edition of Atari Explorer Online a coule oops Couple of weeks ago, when we had a review of them from Andreas Barbiero when he came over to the office and sat down with a Falcon030, and one of those really cool joysticks for about oh...three hours or so. :) In particular, the sound is dramatically better than any other system that I've heard. I'm sure that we'll be able to convince Andreas to come back to the office again, to write a few more lines about Falcon gaming without too much arm twisting...at least until it's time for him to leave the office. :) ga

<[Lou] ST.LOU> Steve Miller is back with another question for you, Bob. Oh, and thanks, Robb.

<[Steve] S.MILLER58> Is the Atari community ever going to be tightened between us and Europe so that when new and interesting software/hardware comes out there, we can take advantage of it here? It seem as if we always have to wait for A LONG time for it to trickle down to us. GA

<BOB-BRODIE> Steve, much of that depends on distribution arrangements. Some of the developers don't like to have to support their products overseas, or mess around with translations. I know that some of the German developers have a hard time with the needs of the US users, as they have a particular view on things like users interface. :) But we are working on those arrangements, and I expect that you will be pleased with the way that things are going to turn out. ga

<[Lou] ST.LOU> I Duckett has another question too.

<[Evil E] I.DUCKETT.> Is there any way I can get info on the Falcon here in New York and support for all Atari system in my area?

<BOB-BRODIE> Regarding info on the Falcon030, there is a wealth of info in the Atari BB area right here on GEnie. We've posted a HUGE amount of information in a number of conferences, and in the BB message area itself. I'd suggest that you look at those files first. After that, I'd suggest one of the high quality mags that are out in the marketplace, like our own Atari Explorer Magazine or the equally wonderful AtariUser Magazine. Both of them do a excellent job of being factual in their reporting. And of course, be sure to check the weekly issues of Z*Net Online Magazine, which is also uploaded here weekly in the Atari Roundtable. We upload our own online magazine, Atari Explorer Online Magazine

here bi-weekly. That should give you plenty of reading material about the Falcon030. As far as support goes, why don't you send me e-mail with your specific questions and I'll be happy to deal with them personally rather than tie things up here any longer tonight. :) ga

<[Lou] ST.LOU> I.Duckett... I suggest you use FEEDBACK and you will get lots of help from my fellow sysops! ;-) Next we have Joe Torres, then Bob Frazier, Mike Allen and Andreas Barbiero.

<[STimpy!] J.TORRES17> (Let me just put down my LYNX - Pinball Jam :>) Does SPEEDOGDOS support a wider range of printers than FontGDOS does/did? I have a Panasonic KXP1142pi printer and was basically told by tech-support 'tough luck'

<BOB-BRODIE> SpeedoGDOS has support for the following printers at this point.. Atari Laser printer, SMM-804, Canon Bubble Jet 10e, Epson FX-80.
Epson LQ-570, HP PaintJet, DeskJet 500, HP LaserJet, NEC P Series Okimate 20, Star NB24-15, Star NX-1000, and of course, STraight Fax as well. :) You should be able to use the Epson LQ-570 driver with your unit. Just be sure that you have the dip switche in the Epson emulation mode. Have you tried that yet? Most of the time you have to have the printer off when you change the switches, and then re-start it. ga

<[Lou] ST.LOU> Thanks... now fellow sysop and RTC Shotgun <shogun?>... Mike Allen

<MIKE-ALLEN> Bob - I wonder if the SpeedoGDOS/Works combo is going to be available through Atari dealers in the near future? I'd really like to support my local dealer.

Also I still have to disagree about the Mega STe. I really feel that it is a product that suffered from improper marketing. A good product that no one outside of the Atari user community knew about. ga.

<BOB-BRODIE> Mike, I respect your opinion about the Mega STE, and share it. However, I don't own enough stock to change the decisions on that type of issue, and have to rely upon my persuasive ability from time to time on those matters. I think that part of the reason that the Mega STE didn't get a better "shove" is because the Falcon030 was expected sooner that this time frame. Now, re the shipments of Atari Works/SpeedoGDOS, the manuals are.. being done now, I suspect that it will be in the March time frame as well. Not two weeks, but likely six weeks at the max. I'm still twisting a few arms here on a couple of points about Atari Works, like allowing the importation of IMG files as well as just GEM files. If we can have that added, I think it's worth a little delay in shipping the product. ga

<[Lou] ST.LOU> Andreas has been waiting very patiently :-) GA

<[Andreas@AEO] AEO.2> Bob, I have been inundated by info from NAMM, and while I might have missed something due to bad phone lines earlier tonite on it, I was wondering if you could comment further on the FEEDING frenzy that went on with the new dealers?

<BOB-BRODIE> Andreas, the timing for NAMM was excellent for us. The write ups in Keyboard, Electronic Musician, and EQ Magazine are very exciting, and it appeared that most of the show attendees had read the magazines. :) We got a large number of dealers that are very interested in the Falcon from NAMM, and expect even more

<[Lou] ST.LOU> Joe has the last question... unless I missed someone's /RAI ? GA Joe Torres...

<[STimpy!] J.TORRES17> I am concerned about the apparent throw away memory boards on the Falcon... The fact that you have either a 1, 4 OR 14 meg board. Why not a user expandable version (I would eventually like a 14 meg... GA

<BOB-BRODIE> Joe, there is simply not enough real estate for that to happen via a normal/conventional means like your basic throw away SIMMS <grin>. What is going to happen with the Falcon030 is the same thing that happened with the STE and Mega STE. People will buy bigger supplies of RAM, and try to sell or trade in their old memory units. Dealers will capitalize on this to have a ready source of ram available. There are already other developers that have announced plans for third party memory boards. For example, Zubair will have a board as well. However, it will not use SIMMS either. There is simply not enough room SIMMS in the Falcon case. ga

<[Lou] ST.LOU> Bob... two more questions and then a wrap... OK? First J.VOGH then John Stanley. GA J.VOGH.

<J.VOGH> What about PC boards for the Falcon? What is the staus of 468 emulation?

<BOB-BRODIE> Oh, that. Had me worried for a second there. As we reported in our online magazine, Atari Explorer Online at COMDEX, COMPO Software is working on a 486 board. I was personally assured by the company president, Theo Bruers, that the product would be done in March. It is to support the full VGA Color, etc, etc, etc. Although I recognize that having such an item is attractive to some people, I think that you will find that products like Atari Works will make you much less inclined to have to sully your machine with MS-DOS. <grin> ga

<[Lou] ST.LOU> Bob... last question from John Stanley...

<[John STanley] JLS> I got here late so this may have already been asked. What's the current eta for MultiTOS? (Ballpark estimates... 2 days, 2 weeks, 2 months, 2 __??__) ga

<BOB-BRODIE> You're right, it was already answered...:) It's done, and will be shipping with Falcons. We're still discussing internally here how we want to handle the distribution of the product to the existing user base. I guess the answer from most perspective will be 2 long. :) BTW, you also missed the drawings for free subscriptions to Atari Explorer, too! :) ga

<[Lou] ST.LOU> Bob... my local dealer wants to order 50 packages of Atari Works. Please tell me what he needs to do and can it be ordered directly from Atari by the individual user?

<BOB-BRODIE> Gee, Lou, he must have been really impressed with it!

<[Lou] ST.LOU> All I did was tell him about my beta copy!

<BOB-BRODIE> At this point, he can't. But we'll be making our dealers aware of all the pricing on Atari Works as soon as possible. The manual will probably be inserted here in the US in the Falcons at this point. It will be available via the normal sources, both directly from Atari, and from our distributors as well. ga

<[Lou] ST.LOU> Bob... what can I say.... I am really excited and can't bear the thought of a few more weeks. Let's hope that our next Dateline Atari! has some real shipping dates. Thank you once again for such a terrific evening. GA

<BOB-BRODIE> Thanks, Lou. As always, it's a pleasure to be online here on our official online resource, GEnie. Thanks to everyone for taking the time to be here tonight, and I hope that you got a little bit better feel for how things are progressing. In our next issue of Atari Explorer Online Magazine, we'll be featuring a preview of Atari Works, including screenshots of the program. It'll be up here in the libraries in about a week for you to download. Thanks again for attending!!

What program locks the port at high speeds? (More than 19.2).. I have tried one, but even doing normal calling with no file transfers involved, it would drop characters all over the place. How can I fix this?

Not only can you mix speeds but you can also mix 1x8 SIMM with 1x9 ones,
provided you keep the same sort of SIMM in each of the memory banks. In
March 93 I installed a SIMM configuration consisting of: One bank of 1x8
80ns SIMMs and the other bank of 1x9 70ns SIMMs. This was done in a machine
belonging to a friend of mine and he hasn't reported any problems
whatsoever as yet.

Of course. MiNT 0.99 compiled with PureC is just that: the same source compiled with a different compiler.

Oh yes: you can't *create* shared-text programs with PureC, true...

>doesn't return an error condition :-)

Atari VDI uses a linked list for managing the virtual workstation data
structures. Therefore there is no limit except the number of memory blocks
in JAMDOS.
NVDI uses an array of fixed length. This is much much much faster than the
other solution, but the number of entries is limited.

No, certainly not, I have a Mega STE4 with 2 70ns Simms and 2 100ns Simms
and never had a problem at all.

But when using a Extra Ram Deluxe card (or any other card for that matter)
in my old 1040STf I do have problems with different SIMMS, very strange
indeed :-)

>
> If anyone does I would need information that I could use with C or Basic
> (that is, function number, parameter list)
>
> Thanks everyone for all your help!
>

As I recall, there are no system calls for hardware scrolling - it is all
done by "talking" to the video shifter directly.

VERTICAL SCROLLING: Is done by merely moving the physical screen address
by 160*number of lines. That is the previous limit of physical screens
being on 256-byte boundaries is no longer true - now they can be on word
(even) boundaries. This could be done via the xbios(5,....) call.

HORIZONTAL SCROLLING: Is done by using a couple of new chip registers.
One set allows the screen to be "wider" - that is some hidden sections
"behind" the border so that things scroll on smoothly. Another register
controls the offset of the display 0-15 - it is this register that allows
for smooth scrolling.

Note that without a hblank interrupt to do cleverer things these affect the
whole screen. Sorry I haven't listed the addresses or lots of details but
I don't carry my documentation round with me. I shall look the full info
up for you - if someone else doesn't beat me to it.

Hope this helps...

718. MultiSync to ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-08 13:04:40 UTC
From: grillo@flash.ATC.Olivetti.Com
Message-ID: <57872@olivea.atc.olivetti.com>
Source record: 40687

I Folks,

Sorry if my question is a FAQ:

Is it possible to hook up a MultiSync Monitor
to my St ?

I know that should be possible but I need more
detailed information, on which requirements have to
have such a monitor and how to connect it to my ST
(do I need to wire myself the cable?)

I own a 1040 St with Hi Rez Monocromatic Atari monitor,
and I'd like to use both my lovely Cubase and some
of the nice games and others color programs, without
2 monitors on my little desk...

Thanks in advance.

Savino

You can use appl_tplay and appl_trecord. (use record to see how mouse actions are stored, then rebuild a mouse movement action, and play it). I never tried this, but I'm sure it will work.

I don't agree. Have you ever seen the SUN VIEW scroll bars where the mouse
follows the scroll bars? I planned something similar: make a scrollbar move
slower than the mouse moves, so that you can scroll through your
document more accurately, and make the mouse move slower than it is actually
moved as well.

Hi Joshua!

I think I can add some stuff to your formatting experiences.

m>I discovered that disks formatted on the ST with
m>DCFORMAT 3.02 leave 2k less to the user than disks formatted on the IBM

This could be due to a bug in GEMDOS. Older versions (at least <= TOS 1.02) just saw 4 sectors (i.e. 2kb) less than there were present. (I don't know if this has bin fixed in later versions of TOS.)

m>But then I thought, "Hey, DCFORMAT lets you format up to 82 tracks.

Virtually every formatting/copying utility today can do so. On most Floppy drives you can format even more tracks. NEC drives e.g. are said to allow 85 tracks.

And even more: You can format a disk with 11 sectors per track. That gives you more than 900000 bytes free space. BUT: 11 sectors can cause writing errors, when your drive speed is too high (i.e. > 302 rpm; 300 is ok, 299 is better)!

All this can be done with pd/sw software like HYPERFOMAT os FCOPY3 (at least the latter might be available from atari.archive).

eehm... Just to be honest: All these things weren't born in _my_ head: I read these things in 'Scheibenkleister -- The slightly different Floppy book' by Claus Brod (the slightly different floppy hacker...;-) Hi Claus!)

Now the MS-DOS part of the game. Usually the IBM BIOS won't understand that a 3.5" disk can be formatted with 82 tracks, 10 sectors or other nice things like that. There might be differences from BIOS to BIOS, depending on version number and supplier, but I wouldn't expect that each and every DOS reads such disks. To manage this you will have to add a special BIOS floppy driver which can handle such formats. There are several of these drivers available in the public domain. Also you will need a copy program, since the DOS diskcopy command won't work (although there are drivers that make such disks look quite ok for the copy and xcopy command).

I'm sorry but I can't tell you any Name of a program that will do this for you. I'm not so much involved in DOS stuff. But I think you should find something on a nice ftp tour, looking for filenames that contain '820' or something similar.

Greetings from Cologne, an keep hacking
Andreas

Source record: 40591

Hi folks,
It seems I've been less-than-perfect in the 'requirements'
section of the docs that come with the MDK. To successfully install
a minixfs partition, you'll need at least 9Mb or so of space for the
programs/compiler etc. on your chosen partition AND (this is what was
left out) 512-byte sectors on that partition. For most of us I believe
that means a partition of less than 16Mb, unless you can tell your
software to specifically format as 512-byte sectors on a > 16Mb
partition. I *think* ICD has this. I'm not sure.

Sorry this wasn't included - My partition size is ~15Mb, so I didn't
come across it. The reason is that 'minit.ttp' needs 512-byte sectors.

Simon.

Source record: 40593

ok, here's a question I've been wondering about for a while. One of my fascinations is with weather and I had written a weather forecasting program on my old 8-bit 1200XL. I now have a Mega ST2 (in the shop for repairs :( ) and am planning on getting a Falcon when they are released.
There are a number of scientific weather instruments on the market which will measure wind direction, speed, rainfall, temp, pressure, etc. Some of these are digital and are equipped with (I assume) RS-232 ports for connection and use to a PC compatible. What I'd like to know is, would it be possible for me to buy one of these units and then write my own Atari-specific software for it? Here are my problems:

1.) Do they use the RS-232 port or do they require an expansion card with a special jack?

2.) Would it be possible to obtain from the company the signals that the device sends over the com line, or would it be proprietary?

3.) If I had to get the info myself, how would I go about reading the serial port in such a way as to decipher the info the device sends?

Any help appreciated! Email or post!

730. Need HELP with "Dr. T's" Music Sequencing Software...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-08 19:55:02 UTC
From: M14563@mwvm.mitre.org
Message-ID: <16B6FD1C7.M14563@mwvm.mitre.org>
Source record: 40678

I am a NEW ATARI-1040ST user. Presently, I am using my Atari to help me sequence music. I have purchased the most recent version of the KCS's "Dr. T's" software (Omega version ?). Though I have become somewhat familiar with this package, I am experiencing a few problems with it. My most frustrating problem with this software involves the "looping" of tracks and/or sequences. Even after painstakingly following all instructions on how to end up with a "clean" loop for a track or sequence, (ie. making sure that the last "deleted event" falls on the first step of the first beat of the first measure AFTER the last measure of real music -- that is, for a 15 bar song, the deleted event should fall on the first step of the first beat of measure 16!) I still experience slight, but VERY NOTICEABLE hesitations when looping from the end of a track/sequence back to the beginning of that track/sequence. I have used quantization where possible, and this helps some, but NOT in all cases. I've tried moving/deleting control changes, modifying durations, changing timings, you name it! I am hoping that someone out there will be able to help me with this problem. I have some important work to do involving this sequencing, so would appreciate any and all assistance in this matter. (Oh, by the way, I did call Dr. T's technical support line and talked to them for about one hour about this and other problems. Unfortunately, they could give me any additional insight into this particular problem.)

My configuration is an Atari-1040ST with 4MB RAM. I am running the software from a DD floppy drive.

I would also be interested in knowing how the package "Master Tracks Pro" (?) compares with the Dr. T's package. I have heard a few negative things about Dr. T's and have heard that "Master Tracks" is better. Could someone out there give me a brief pros and cons list? (And, if by chance you have a pros and cons list for Dr T's, that would also be appreciated.)

In advance, thank you so very much for your time and help.

Sorry for the extensive quoting, but you need it to see where to put my 2 cents in 8-). When you regard everything as a file, or rather a stream of characters, you lose any other structure the data may have had originally. I would prefer to pass data with all its structures intact, assuming that that is at all possible, rather than have to reconstruct the structures at the receiving end. Languages with persistent objects are a good example of what I mean. Doesn't everyone hate having to write the code to store and retrieve the structures you so painfully wrote for your running program. I would much rather see everything, **even files** regarded as elements of an object oriented database that includes methods as well as raw data. That way we wouldn't rely on position in the file hierarchy and/or name extension to identify the contents of the file. Files as the metaphor for everything began to wear thin when terminals began to replace teletypes - whose output was a stream of paper with your characters on it 8-). Screens are not well served by considering them as a file, I imagine that the Un*x Curses sources bear me out on this. It's much better to regard a screen as a 2d beast that you can write at any part of - if you don't, you have to repaint the whole screen to just change a little of it. Imagine what you would do to reformat user output on a teletype - its rare, but I have seen this kind of behavior on Unix screens and frankly it's stupid. In sum, yes, files are a useful abstraction, that Un*x especially beats to death, but we need a higher level of abstraction to handle what we want to do today with what we have. I trust I have expanded on Ian's complaint enough, and he can answer (and probably has 8-) for himself, but this has been bugging me for quite a while.

The problem that I described in an article does the exact same thing when I remove the INIT= line from my mint.cnf file. Mint prints it's little welcome screen and then it just freezes up. :-(I am using the same compiler on a Mega2ST with 4 megs ram w/ 68000 processor.

> Any idea why a MultiTOS MiNT kernel would be different from a "SingleTOS"
> MiNT kernel? I haven't bothered trying to analyse the code; I just want
> to use it!

Beats me.

As my previous post also stated the login shells do not read the .profile files at start up (login shell). I was informed that it says something to this effect in the Mint Distribution Kit. Any insights? As I also stated before the login shells read the files just fine in Mint .96. Eric suggested making sure that -DMULTITOS was not included and that my HOME env was defined - all of it is and was as it should be.

735. Need help expanding memory of Mega St2

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-09 00:54:28 UTC
From: aburgh@iastate.edu
Message-ID: <aburgh.729219268@du139-210.cc.iastate.edu>
Source record: 40682

Hello,

I have been trying to add 2 megs to my Mega, but the new memory doesn't work correctly. The memory *does* show up, but bits are constantly flipping--a phenonema which is evident on the screen. When I first boot up, everything is fine, but the screen quickly becomes garbled. The screen takes on a 'tiled' look with each tile the size of 2 characters, and apparently all the tiles are identical, but I'd have to look closer to be sure.

To install the memory, I dropped in sockets and by-pass capacitors for the chips, put in 3 resistors in a row of resisters immediately to the left of the memory chips, and plugged in the chips.

I know this is sketchy to begin with, but I figured it'd be easier to let someone ask me appropriate questions rather than me providing lots of useless info.

So, can anyone offer any suggestions?

Thanks,

Aaron

736. Help with 5.25" floppy drive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-09 01:02:15 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <83826@hydra.gatech.EDU>
Source record: 40683

I recently picked up an external 5.25 inch floppy drive from a PC store that was moving and clearing out old merchandise. I decided to try to hook it up to my ST using the instructions I found on atari.archive. These were the pin connections given in that document.

Atari ST PC 34 pin card
14 pin DIN | Description | edge connector
---
1 | Read data | 30
2 | Side 0 select | 32
3 | Ground | 34
4 | Index | 8
5 | Drive 0 select | 12
6 | Drive 1 select | NC
7 | Ground | 34
8 | Motor on | 16
9 | Direction in | 18
10 | Step | 20
11 | Write data | 22
12 | Write gate | 24
13 | Track 00 | 26
14 | Write protect | 28

This configuration did not work. It appeared that pin 12 on the PC card edge was indeed the proper drive select line for drive 1, but in the above it seemed to me that I should use pin 6 of the Atari DIN instead of pin 5 for the drive select. I tried that and it still didn't work. I believe the drive is configured as drive 1 since there is a four way jumper numbered 0 through 3 and the jumper is across 1. There are two other jumpers on the drive mechanism that I did not touch since they were not labeled. I did buffer the outputs from the Yamaha sound chip so I wouldn't fry them.

Exactly how does the ST go about checking whether drive B is present or not? Perhaps I could emulate this with software and monitor the outputs to see which signal is lost.

I have collected most of the MINT distribution kit and have a few queries...

1. My screen length is set to about 20 lines.. This is true even when you
view a file from the GEM desktop.

2. I run a shell - KSH but the files I create are not owned by 'clive' (ME!)
how do I get around it?

Thats it...

738. Falcon architecture

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-09 09:21:05 UTC
From: mpnolan@unix1.tcd.ie
Message-ID: <mpnolan.729249665@unix1.tcd.ie>
Source record: 40685

I have been listening to the debate on the Falcon for quite
some time, and have a few questions of my own...

1/ Is the Blitter on the Falcon worth the silicon it sits on?
- would the blitter, no runnig at 16mhz be of any use in
say games, for moving sprites or backgrounds?
- and more importantly, is it 32-bit?

2/ The hardware scrolling on the Falcon hasn't seen much light..
- WHAT exactly can it do?
- and is it of any use in games?

3/ Now that the Falcon has THREE sound chips (ST,STE,FALCON),
- can you play all 15 tracks together?
- and does the 8-track 16-bit falcon sound chip
take much bus bandwidth?

After hearing that the Falcon had only 16-bits for its CPU->MEM bus, I
was quite disapointed, but with 32-bit graphic bus(where all the REAL
work gets done) and on-chip cache, it actually may have been a smart
move on Ataris side!

One last question....

*** Will we see games with GOOD background music, in either 8 or 4 tracks?
- or is the cost in speed too much?

Thanks in advance. Sorry for all the questions. Please, no amiga fanantic
babbling!
-MARK

739. Re: Atari formats PC better than PC

Newsgroup: comp.sys.atari.st.tech

wrote:
>(an interesting comparison of ST and PC disk formatting speed and
>compatibilty)

I myself had some strange experinces with ST and PC disks.
My PC at work reads ST formatted disks fine as long as the first three bytes
of the boot sector are EB 34 90. This even works for 10SPT disks since DOS 5
does not seem to mind. However my PC at home, also running DOS 5, reads ST
disks really slowly and sometimes gets errors. I wondered why so I formatted
four disks on the ST all with completely genuine MS-DOS boot sectors.

9 SPT-no skewing, 9 SPT-skewed, 10 SPT-no skewing, 10 SPT-skewed.

The PC would read none of the disks fast/reliably. *BUT* When I formatted the
disks exactly the same again using the Falcon they were all perfectly
readable by the PC. Why? The Falcon has a high-density disk drive. It seems
that my PC does not like low-density disks that were written using a
low-density drive. I have seen other PC's with this problem.
I also find that the Falcon drive reads just about anything that my PC has
trouble with and that includes high-density disks too.

On a related note, I found that Flopfmt on the Falcon will format a track as
high density if the SPT is greater than 12. This is fine but I don't know
how to write the track after that since the hardware defaults to low-density.
I guess I need to pass some sort of flag to Flopwr but what? The dev-docs
say nothing about this (what's new?) which is a pity because I was planning
on a 1.6Mb (20 SPT) disk formatter. Anyone got any ideas?

This is normally due to either your TERM environment variable being something
not in your /etc/termcap file, or your termcap file being broken in some way.

The termcap file problem would normally be something with newlines being in the
wrong places, or it could be that the termcap entry tries to include the
settings of one of the other entries (the tc capability if I remember
correctly). Have a look at your termcap file. Try to make it into one entry
(instead of including) and perhaps into one long line.

NOOOOO! That's EXACTLY the sort of thing you SHOULD NOT do!

The GEM interface has a very well-defined idiom for how window scrollers work. Software is available and is widely in use that allows users to adjust the mouse response rate to their preference. If your application behaves differently than other GEM applications, it will be perceived to be broken. Indeed, it WILL be broken, by definition.

I guess the problem arises because you don't have any _monospaced_ gdos
fonts installed. These programs are not capable of using fonts with
arbitrary letter-width. Try installing the fonts that came with your
german programs.

Hope this helps

745. Other MiNT compiling problems (prgflags, strip)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-09 23:40:01 UTC
From: knarf@cubenet.sub.org
Message-ID: <8754@salyko.cubenet.sub.org>
Source record: 40603

Hya all!

I just have installed the GNU C-Compiler Version 2.3.1 on my FALCON
using the MiNT-LIBs PL25, because I want to compile MiNT 0.99.
After some problems with asm.y (I forgot to install the bison),
the GNU make stops now, because it can't find 'prgflags'. I think there
should be anywhere a prgflags.ttp and a strip.ttp, but I don't know
where to look for these files. They are neither included in the MiNT
Distribution Kit nor in any MiNT archive I have.

```
#
# Makefile for MiNT using the GCC
#

[...]

# add -DMULTITOS for a MultiTOS kernel
# add -DONLY030 for a version of MiNT that needs a 680x0, x>=3

# ** this was the only one part I changed,
# ** because I don't have MultiTOS

#DEFS = -DMULTITOS
#DEFS030 = -DMULTITOS -DONLY030
DEFS030 = -DONLY030

[...]

all: mint.prg mint030.prg

# here my problem begins...

mint.prg: $(OBJS)
$(CC) $(CFLAGS) -o mint.prg $(OBJS) $(LIBS)
prgflags 7 7 mint.prg
strip mint.prg

mint030.prg: $(OBJS030)
$(CC) $(CFLAGS030) -o mint030.prg $(OBJS030) $(LIBS)
prgflags 7 7 mint030.prg
strip mint030.prg

[...]
```

Where can I get 'prgflags.ttp' and 'strip.ttp'?

Is the 'mint030.prg' automatically with memory protection? Are there any
other settings I have to change in the makefile or anywhere else?

Thanks,

Knarf

P.S.: Are there newer MiNTLibs available than PL25? Where? Is the big bug fixed, Eric Smith told us about some weeks ago?

746. Mint and problems

Newsgroup: comp.sys.atari.st.tech

Message-ID: <1993Feb10.015633.17379@sactoh0.sac.ca.us>
Source record: 40602

I'm trying to install Mint on my MegaST4. I've managed to
get everything set up and figured that was it. Now I've
read a couple of messages about compiling Mint. Huh?
I'm sure I missed something but I don't recall reading anything
about compiling Mint in the Distribution kit.

Assuming I didn't miss anything, when I open a TOSwin, I have
to change over to my Mint partition and select which shell I
want to run. When I run the shell, I'm put into the dir of
"bin". One would think that I would be placed in my home dir
on startup but this isn't the case.

I'm pretty sure I'm missing some type of config file(or haven't
set it up yet) because trying to run GCC gets me the message of
"can't find it" or something like that.

I did set up Mint like the distrib kit suggests but like I said
above, I must have missed something.

Anyway, any and all help is greatly appreciated.
Thanks, in advance.

747. GTS100X Disk Drive Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-10 04:23:30 UTC
From: ak354@cleveland.Freenet.Edu
Message-ID: <1la002INNsn7@usenet.INS.CWRU.Edu>
Source record: 40599

I have a Future Systems GTS-100X disk drive which will not read disks properly. It always gives a blank directory, but Show Info will give 0 bytes used and the correct number of bytes remaining on the disk. (How does it know that if it can't read the directory!) The mechanism internal cable and external cable are not the problems since I have swapped them out. The circuit board just has traces to connect the 14-pin Atari DIN connector to a 34-pin header for the ribbon cable to the drive. ANy ideas on where the problem could be?

>Distribution Kit nor in any MiNT archive I have.

a) You don't need prgflags. chmod could do the trick; it seems
unnecessary, since gcc sets the appropriate flags on executable files.

b) Consider looking for xstrip instead of strip

>mint.prg: $(OBJS)
> $(CC) $(CFLAGS) -o mint.prg $(OBJS) $(LIBS)
> prgflags 7 7 mint.prg
> strip mint.prg

>P.S.: Are there newer MiNTLibs available than PL25? Where? Is the big

PL25 appears to include those bug fixes, as it seemed to appear out
of nowhere in the same fashion that recent postings of MiNT sources
have come.

You can be sure. Actually I am running a 28MB minix fs, where GNU-C
resides. This partition was installed using the ICD formatter. And of
course, it consists of 512byte-sectors.

>Sorry this wasn't included - My partition size is ~15Mb, so I didn't

I have a program called SPEECH.TOS or SPEAKEZ.TOS, which when you type in ascii it gives a crude, but effective, speech synthesis. It also prints out the phonemes that it is speaking.

Does anyone have the source code for this, as I would like the bit which generates the phonemes to use with a speech synthesiser chip.

viewing it from the desktop ?

} 2. I run a shell - KSH but the files I create are not owned by 'clive' (ME!)
} how do I get around it?

The uid/gid bits of the minixfs filesystem are set by the uid/gid that
you *actually* are. If you aren't using the multi-user mint style, then
you'll find that you're set to uid 0 and gid 0 (ie: root/system). If
you want clive/users rather than root/system you'll have to set the uid
and gid using a program - I'm not aware of any program to do this, but
it's fairly simple. Look in the source for init (by S.Usher) to find
how it's done.

Simon.

> [my feelings about MiNT]

I've decided I have to be a bit careful what I say. As a developer under non-disclosure I could be commenting on pre-release software (a serious no-no) without realizing it. I'm not sure if what I have is MiNT like the rest of the world has seen, or something not yet released.

Still, I don't like it. It's too slow to be usable. It's confusing as hell to use, what with some programs replacing the desktop, other programs not doing so (leaving you with program B running over program A's desktop). If you don't have it configured just right, it doesn't work at all and doesn't give you any indication why not. (It was two days before I figured out the incantation for getting a plain old TOS or TTP program to run. I can't imagine how a non-tech user would make things work at all.)

From a programmer's point of view, it gets in your way and slows down the machine, and there's no way to turn it off programmatically. In developing an animation graphics product, I found that it just slows the system down so much that you can't achieve realistic playback speeds or smooth cursor movement during drawing. That means I have to tell customers to run the product only when MiNT is not active. Are they going to perceive (correctly) that MiNT is at fault? Probably not, they're more likely to think my product is broken. Atari shouldn't put me in that position.

It seems to have been designed with text-mode applications in mind, with GEM support as an afterthought. That's exactly backwards of what it should be. In fact, in my opinion, Atari screwed up bigtime by having a character-mode BIOS and the idea of a non-GEM application supported at all. If all applications for the ST line were GEM programs, this machine may have become the user-friendly tool it was originally intended to be (and thus a commercial success), instead of being a cheap toy for unix-head programmers.

> Falcon...is the blitter chip any good

It makes a definite and noticible difference. Both in normal GEM programs and the desktop, and in specialized applications, you can visibly perceive a big difference in speed if the blitter is turned off. (The specialized application I have in mind is Cyber Paint, which does a lot of blitting type operations. Doing them with the blitter on is so much faster it's hard to describe the magnitude of difference.)

> after hearing the Falcon has only 16-bits for the CPU<->MEM bus

I saw that posted here too. I'm not sure I believe it, but I saw it. It could be so, but I wonder if someone just looked at the electrical spec for the internal expansion bus (which does only have 16 data lines) and generalized that the entire motherboard has the same geography. If so, I'm not sure that's a valid generalization.

Source record: 40609

More possible problems with my Mega 2. A friend (who now has a mac) lent me his old 520ST to use in the interim. I hooked it up to my mono monitor and got the exact same results as with my mega (no picture, no boot, eventual hiss from the speaker). So, I tried hooking it up to my color monitor. The monitor works fine, except there was still no boot, and the video display was garbage (like the video was being scanned from the wrong part of memory). The question that immediately rose in my mind was: Is my mono monitor responsible for killing the CPUs? What I'd like to do is check the mono monitor pinouts for resistance to see if there is a short, but I have no idea what the proper values should be, and obviously some will be different from the color monitor.

In short, my question is, does anyone know what the resistance values should be for each pin of the SM124/5 monitor? If there is a short in it that is blowing out something in the CPUs, I'm going to have a fit! I should've tested` my friends computer on the color monitor first.

758. MiNT Control

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-10 22:20:48 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2b797fd4@p12.f202.n281.z2.fidonet>
Source record: 40607

Hello All!

With the release of MultiTos not that far in the near future, we would like to present you a program we wrote to make life easier when using MultiTos. This program is called MiNT Control.

MiNT Control is a control accessory for MultiTos. It enables the user to access various functions provided by the operating system in an easy and comfortable manner. Let me list some of these functions present in the current beta version:

- All processes can be displayed, killed, halted, continued, their priorities can be changed and various amounts of information on a particular process can be listed. (eg. how much memory it consumes)
- Information on global system memory usage can be listed.
- Program flags can be changed. Supported are: fastload/TT Ram run/TT Ram malloc, private/global/super/readable and the shared text flag.
- The MultiTos config files (MiNT.CNF and GEM.CNF) and the system environment can be easily edited through the use of popup menus.
- Processes can be started through the use of a kind of batch files, which enables the user to run one or multiple processes with a given priority, maximum memory usage, environment, command line, default directory, etc. A comfortable full-GEM editor is implemented in the program.
- At startup, the processes running (eg. your Auto folder programs and accessories) can be given a certain priority through the use of a configuration file.

MiNT Control runs on (Mega) ST(E)'s, TT's and Falcon030's. It requires a minimum resolution of 640 x 200.

What we would like to hear from YOU are suggestions. While reading the list above, has a certain feature come to your mind which hasn't been listed? Tell us! If there is anything you want to see implemented (like process startup time scheduleing), please do let us know! We can think of lots of things, but don't want to overload the program with features. It's better to have a functional not so extensive program which people USE than to have a large program, loaded with exotic features which nobody uses, and which only consumes a lot of memory.

So give us your ideas!

Thanks in advance!

Send all your ideas, comments, illuminated enlightments to:

>

I have seen at least one such -- it is called 'atfmt100.zip' and should
be available on your favorite simtel mirror. As you say, it does require
a special BIOS driver to get the best use out of it, but it allows MS-DOS
to put 82+ tracks and 10+ sectors on what would normally be a 720K floppy.
I haven't experimented with it to see if there is any problem reading such
between MS-DOS and TOS. One thing for sure -- Norton Utilities thinks such
disks are really messed up!

> > the mouse follows the scroll bars? I planned something similar:
>
> NOOOOO! That's EXACTLY the sort of thing you SHOULD NOT do!

I agree. An app should never move a visible mouse cursor on behalf of the user. Sunview is revolting, IMO. I can't stand it. Every time a dialog pop-up comes up (a yes/no type thing), it moves your pointer to one of the buttons - I then instinctively move the mouse, and move it right out of the damn dialog box. Really stupid.

However, I think there is a definite use for being able to position the mouse cursor to an absolute (x, y) - when the cursor wasn't visible in the first place, and you want to establish a start point (like the center of the screen) when you do turn it back on. But ONLY if the cursor was invisible for some time when you plan on moving it. In fact, I need to do this right now in a program I'm writing. So, is there a clean way to do this, I haven't scanned the GEM calls yet for this.

>P.S.: Are there newer MiNTLibs available than PL25? Where? Is the big
>bug fixed, Eric Smith told us about some weeks ago?

Since I'm now maintaining the libraries, I'll answer this...

Patchlevel 26 was a beta-only release and not generally available.
Patchlevel 27 will be a general release unless I get lots of feedback
from people who beta-test it that certain things should be fixed
before release. Patchlevel 27 was delayed by about 2 weeks due to
serious hard disk problems, which I've only just resolved. Time
permitting, it will be done by the end of this week or the beginning
of next, and an update should be on atari.archive by the end of next
week.

The "big bug" in the dirent routines was fixed in patchlevel 25.

Cheers,
entropy

chmod and prgflags are two different things. But yes, it's pretty much redundant if you're using the most recent version of GCC and gcc-ld.

>b) Consider looking for xstrip instead of strip

Yes, xstrip is the executable that strips TOS executables. You'll find xstrip.ttp and strip.ttp (which strips .o files), the newest gcc-ld, and lots of other useful stuff in Gnustuff/Tos/Utils/utlbin33.zoo on atari.archive.

No, setting those variables won't make any difference. Since the shells started by toswin aren't login shells, they correctly leave you in the current directory for that process, which, at startup time of that shell, is the directory from which that shell was loaded.

It may be annoying, but it's correct :-)

The best solution is probably to write a small program which changes directory to $HOME and then exec's $SHELL, and run that from toswin. I haven't bothered to do this myself, as I don't use TOSWIN on a regular basis (too slow on a stock 1040ST, IMHO) so I can't provide sample code right now.

Cheers,

You can check which ones go directly to an RTE instruction. I doubt any sane program will take a vector and have it point at nothing !

Patrick.

766. 4 meg simm diy upgrade for 1040st?

Newsgroup: comp.sys.atari.st.tech

This is exactly what I like with TOS and MultiTOS: good integration of graphically
oriented and text mode programs -- especially when running a decent environment
like Gemini. If TOS wouldn't do that for me, I'd probably switch to the Mac.

The problem is, you get some signal deteriation.

Possible solutions :-
Use SCART.
Use a signl booster between the RF out and video.

With floppies it's not a question of "interleave" but of "offset".
The two characteristics have similar reasoning but are quite different.

>computer generally reads more stuff than it writes.

The read time will be affected by the offset and whether the
offset is properly matched to the seek time. But for formatting, you
don't seem to realize something. DCFormat (and some other formatters)
don't verify. I wouldn't really want to use a formatter that doesn't
verify. Bad disks are actually pretty rare, but it happens. For 3.5"

floppies, which I've been using since I bought my 1040ST (just a little while after the 1040ST was first on the market). I've only had about 20-30 floppies that were either bad "out-of-the-box" or that went bad after some use. That's maybe around 1% of my floppies. But a I don't need the headaches of finding out I have a bad disk by losing important work.

771. Falcon overscan and SVGA

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-11 14:28:42 UTC
From: kgrubb@cee.hw.ac.uk
Message-ID: <1993Feb11.142842.19240@cs.hw.ac.uk>
Source record: 40543

I was reading recently a re-posting of a John Townsend article which mentioned overscan on the Falcon. In it he said that if the user was using a SVGA monitor, then any program which used overscan would only display the centre part of the picture. This is good for compatability i suppose. However, I was using a program which displays some true colour overscan pics'. It works fine with a colour monitor, but produces nothing but a mess on the screen when used with my SVGA. What gives? The only thing that I can think of is that the program accesses the hardware directly instead of using the system call for overscan and this screws it up. Any ideas out there?

KEV.

772. MiNT/Toswin/Nice/etc...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-11 15:41:28 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1239@usdtsg.DaytonOH.NCR.COM>
Source record: 40619

I have a question regarding MINT/Toswin and Nice (renice).
Say I load in MiNT and GEM (i.e., nothing at the INIT= line of the
configuration). I then wish to run RZ.TTP in a Toswin window. However,
it (RZ) hogs up alot of processor cycles (and thus slows everything down
WAY too much). How would I go about renicing the processes (changing
the priority of this application) so that less processor time is
used up by that particular application. (assume I'm downloading to
a ramdisk - so speed there is not a factor).

Would I have to load in a CLI (like TC Shell) and then run NICE
or RENICE from there? I would guess I wouldn't *need* to do this,
except for the fact that I need to do a PS to find out the
process id to do the nice on. Or could I, in one command line,
run RZ.TTP and RENICE it in one Toswin window?

Any help would be appreciated.

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

(this was one of my gripes with MultiGEM - while I could run multiple
programs, I couldn't change priorities, and thus some things like
zmodem were taking up too much time slicing)...

>should be quite practical, I expect.

It would be very very very useful if someone would go through the trouble
and convert it to C -- there's a Modula-to-C converter out there somewhere.
I suspect that it might be a lot of work though, since I don't know much about
Modula and haven't got a compiler for it I never looked into the TeXDraw
sources [even though I got them].

>I'd suggest taking a look around Comp.text.tex, for their FAQ. As far
>as using the tools on the Atari goes, it's a little difficult to find

Not really, since almost everything in the Atari TeX implementation is standard
-- the info is a little hard to find sometimes.

>I'd like to find out if the New Font naming System can be used with
>CS-TeX; it APPEARS not, but I'm not certain.

Yes, it can. I am no expert on this (like you, I just want to use more fonts
and maybe switch to the new standard, the DC fonts), and I have never tried
it on my own TeX installation, but I know for a fact that it does work.

I suggest you look for help in one of the TeX groups.

Is it at all possible also to distribute the update as a 'diff' from
mintlib25 to mintlib27 ?
That would be a great relief (atleast for me), as I always download
the sources and thus have to recompile. If the upgrade was distributed
as diffs, one would only have to recompile the changed files.

Cheers
Erling

It is an almost unknown fact, that all STE computers provide a standard
video signal at the monitor port. It is the SAME pin as the composite
sync! So just connect the composite video pin with the input
of your VCR and it will work in all color modes. Don't forget to connect
GND, too ;-)

Hi,

I am not sure, if I will be able to go there, though I would really like to do so. Anyways, I guess, it would be a good idea, if some kind of meeting place for all InterNet-users could be agreed on --- I would suggest something along the lines of, every day at 12:00 anybody, who is interested in meeting those people he has been talking to by mail/news for years, should come to the entrance of the Atari press lounge.

Feel free to discuss this idea or come up with something more useful than this... :-) (Maybe, somebody could volunteer to keep a list of all InterNet-users who are going to come to CeBit...)

If you just wanna read a variable, the occasional Supexec can't really
hurt. I wouldn't go overboard there with adding VBL stuff or new Trap
vectors. The taskswitches in MultiTOS won't be that fast that you'd
notice the difference. it's only when you go into supervisor mode and
start calulating Mandelbrots or somesuch that will take more than ummm
lets say 1/2 Vblank (just to name something plausible) that you will get
users that are extremely pissed off at you.

Nat!
P.S. 1/2 Vblank is a LOT of time.

>Thanks,
>Steve
><selick@csa.bu.edu>

This will not work. A 4 meg simm has 2 more address lines than a 1meg simm. The atari does not have these signal. Also, a SIMM is 8-bits wide, whereas the ST's 68000 accesses memory in 16-bit chunks. Any memory in the st requires 16-bit path, so _two_ simms is the minimum. This explains the possible memory configs of the ST. Two banks of memory, each bank can contain 16bits of 256k or 1M chips (some say 128k as well...). Thus:

```
Bank 1 Bank 2 Total
---------------------------
256kx16 empty 512k
256kx16 256kx16 1M
1Mx16 256kx16 2.5M
1Mx16 1Mx16 4M
```

Of course, you can swap the banks on some machines. There are also some weirdnesses associated with various MMUs that atari has made that prevent the use of some combinations.

Now for some useful information. You can upgrade your machine with 2 or 4 one meg SIMMs. My method was to take a pair of wire snips and cut my old memory off the board. Then I unsoldered the pins and ran the signals to the appropriate pins on the SIMM. Voila! 2.5 Meg, in my case. I just came across my notes, with the SIMM pin numbers and the signals on each old memory chip socket. You might look on an archive, though, as there are walkthroughs much better than any info I could throw together.

783. Some progress but still problems with 5.25 inch drive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-12 00:30:15 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <84399@hydra.gatech.EDU>
Source record: 40549

The problem didn't turn out to be one with the drive select line as I suspected and a few of you informed me about. There were two problems. First, it appears the the WD1772 in my Mega STE and the output buffers (if any) on the line ports couldn't handle two drives. Great, huh? The other had to do with isolation between the +5V and +12V of my power supply. A couple of rectifiers solved that problem but drop my supply voltages by 0.7V or so. Now the drive gets selected and the motor spins, but I only get bad disk or write protect on error messages when I try to access it via GEMDOS.

Could it be that the drive has been damaged by the lack of isolation between the power lines? Has anyone else had to add buffers to all lines between the floppy port and the drive? In order to get this far I've had to buffer pins 2(side select), 5(drive select), 8(motor on), and pin 9 (direction in)). I've tried buffering some other lines but it didn't make any difference.

Any comments will be appreciated.

Right. That's why you should be using Twister 2.2 (from one of the
last Start mags). It does very thorough verifying and error checking.
I should know. :}

> I've only had about

Yipes! That many! I have had maybe 1 or 2, out of hundreds. Many of which
I don't use much, though... I haven't even had trouble formatting some
SS disks to be DS.

> That's maybe around 1% of my floppies.

What?! You have 2000 floppies? One or more of your numbers must be a
bit off. :}

Yes. And I hate it. Add my voice to the "Leave My Mouse Alone" chant. It's
bad enough when programs popup forms/dialogs under the mouse rather than in
a set position (didn't any of them read that paper which says users can only
learn to use an interface if it doesn't change all the time).

Patchlevel 27 of the library will be a full source release (if I release it for general use at all; that I'm leaving up to the testers). Future releases will be available as diffs, full source, and binary (hopefully.)

Recompiling only changed files in the library is non-trivial because of all the different library models (short/long ints, floating/integer libs, absolute/base-relative).

If I can get onto a dialup I can actually upload to (you don't wanna know how strange my net connectivity is) tonight, I'll be sending out patchlevel 27 to the mailing list (yes, it's finally ready!)

In a toswin shell window, type:

nice -20 rz

to run rz at the lowest priority. You do not need to start it and
then change its priority if you do it this way.

Some versions of rz also eat all available memory, so you may want to
do:

limit -M 1024k nice -20 rz # I think that's the right syntax for limit

You of course need limit.ttp and nice.ttp. I believe Eric supplied
versions of these in the mint utilities.

The pc is not faster. The momment you start loading anything into it it
slowwwwwwwssssss.
The pc hasn't undergone any serious architectural development in ages.
All it really has is a bunch of better chips to make up for bad design.

You really can't compare the two properly. Open verses closed arch. OS on
chip verses OS on disk.

Any given IBM pc is usually a mismash of clone parts and periphels.
All ST are basically the same.

give it up guys. It's just politics you're arguing. Trying to make out
like you wer'nt the one who may have made the dumb purchase.

Give it ten years and they'll all be archaic pieces of trash. No matter
who made them.

789. Ghostscript -> .GEM Metafile device.....

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-12 11:18:15 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <C2C22G.6o0@newcastle.ac.uk>
Source record: 40639

I have just been looking at the ghostscript sources, and am wondering if anyone else has attempted a .GEM device before I have a go myself.

I have a CAD package (Galaxy CAD) which only outputs postscript, and would like to use the drawings (which are very high quality) in Calamus / Pagestream as vector files so that I can resize them easily (I'd rather avoid .IMG format as bit images don't scale well).

My initial thoughts were to modify the stvdi device code to open a META.SYS device (only under GDOS for this one) instead of a screen device and let the stvdi code write out as usual. Can anyone see any problems with this ?

IMHO a postscript to .GEM file convertor would be quite useful to the world at large as well as to me.

Comments & sugestions please...

790. Problems with MiNT 0.99

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-12 11:37:45 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <C2C2yx.BE1@dcs.ed.ac.uk>
Source record: 40640

Hello,can anyone please help me ? I compiled MiNT 0.99 on my
TT on wednesday,and while the compilation went fine,and produced a
working version of MiNT030.prg,I am having problems with the memory
protection that Mint 0.99 has added.For example on my system ls.ttp
no longer runs - I get a 'Memory violation type super' error and
EMACS v18.57 produces a similar error when you try to save anything.
Is there anything I can do to get these programs to run ok?
I tried removing the memory protection by following the notes
in memprot.c and setting int no_memory_protection=1; but when I
recompiled this,I got a version of Mint030.prg which printed "Sorry,
this version of Mint need s a 68030 to run"!!!!!!

I also would like to know how exactly I can get at the screen
directly from my programs,without being smacked by the MMU as I am
trying to write a set of fast graphics calls that will probably live on
Trap #7.

I really hope that someone out there can help me,

Cheers ,Joe.

P.S. I am using GCC 2.xx from the Mint distribution kit.

Several months ago,I was looking for the opposite ie. a GEM to Postscript converter,but found nothing suitable. I wanted to convert GFA draft files saved in GEM format to PS files for printing on a apple laser.

I think it would be useful for other packages that use GEM format, but don't provide printer options.

>offenders are Connect 1.91, 7_up, Everest 2.0, and qed 3.02. I've tried

This is due to the german sense of order. We always want everything to look uniform, so do our GDOS fonts. All characters must have the same width.

The real answer to your problem ist, that all these programs are Editors or terminal emulations. Writing such programs in a way, that they work with proportional fonts, is very hard work. Personally i don't see any benefit from using proportional fonts in editors or in a terminal emulation.

So, if you only use proportional fonts for your DTP applications, the german programs don't give you access to them. You must also have some monospaced fonts in your ASSIGN.SYS (and the GEMSYS folder), f.e. ATTP10.FNT.

Greetings, Hayo Schmidt

794. Interupts and PCM sound

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-12 13:53:18 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1993Feb12.135318@cs.bham.ac.uk>
Source record: 40545

Hi!

About a year ago I got hold of a SoundTracker player for the STE that ran on the Timer interrupts. Timer B I think... [the one that reacts to the PCM soundchip]

I've made loads of changes to it but it crashes from time to time when other things are going on. Then I noticed something wierd in the programming. The interrupt software ran like this:

Start of interrupt
Clear interrupt flag
Do code
End interrupt

Now surely this means that the interrupt could be interrupted by itself? So I moved the clear instruction to the end of the code. All well and good but the code is long enough to naff up kbd and mouse actions. So for the time being I have returned the clear to the start and I now set my own flag to say that the code is running. If the interrupt is called during this, it acknowledges it and RTE's.

It work's quite well... If the system load is high then the music slows down, which is good. But it's not the proper way to do it!

Can someone tell me how to do it properly, please? Can you raise the priority of ikbd handler to above the one I'm using?

Thanks in advance...

David.

p2c may be able to do some translation; it could be more trouble than
it's worth. At "best", the program (p2c) is ENORMOUS, and it is
probably a problem just to get IT compiled.

I'm not doing anything on it THIS month in any case.

>it on my own TeX installation, but I know for a fact that it does work.

I certainly stand corrected. I got it to work, and likewise for
AMSLaTeX, and the AMS Fonts. The next thing is the mfpic system, that
generates pictures/graphics using MetaFont, with the MF code generated
using TeX macros.

It works, and allows one to avoid the use of \special commands, as the
graphic is turned into a character in a generated font, which means
that it's really not anything "\special".

Does anybody have a program that generates vector graphic objects,
preferably that a) knows something about bezier curves, b) (major

bonus:) outputs information as a text file, and c) Is a GEM App?

Should I start looking at GDOS Meta-files?

A GOOD GEM-based program whose output can be translated to mfpic could provide a nice, clean way of producing PORTABLE graphics that can be handled by any version of TeX.

PostScript drivers for GEM exist (one is distributed with Timework's
Desktop Publisher, I know). You can easily write a program to execute
a metafile on an arbitrary device. Combine the two, and you've got a
GEM-->.PS converter. The PostScript you get out won't necessarily be
easily readable, but it will be something. Please forgive me if
you've already investigated this option.

The question is TOS 1.0 compatibility--1.4 and up will take up to 32MB as a single partition with 512byte sectors.

>You can be sure. Actually I am running a 28MB minix fs, where GNU-C
>resides. This partition was installed using the ICD formatter. And of
>course, it consists of 512byte-sectors.

I once ran, though I am not running now, a 40MB partition with 512byte sectors--the information pertaining to doing so is in the minit documentation. It was pretty neat, but I had too many niggling problems with TOS programs that weren't quite totally happy with MiNT--which I had to have to access the partition. So I had to return to a (mere :-) TOS partition.

It wasn't terribly hard, if you have a sector editor, and can change the information in S0,T0. It helps to have some sort of documentation about what exactly you're changing (like the Atari DevDocs).

Mike.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a 1040 STe with 2 megs. It has an intermittant problem: sometimes the display freezes, the keyboard does nothing, etc. When I turn in off and on again, or press the reset button, sometimes it reboots, and sometimes the screen stays completely dark. Sometimes it cures itself quickly (5 minutes), and sometimes it takes a day, and sometimes a trip to the Atari doctor, who can find nothing wrong.

We were told by one Atari doctor that this is caused by a chip working loose from its socket. I've tried taking the covers off and pressing the chips down - again, sometimes this works, sometimes not.

Can anyone suggest to me what might be causing this annoying problem, and how to alleviate it? It's driving me nuts. Replies by email please - thanks.

801. argv[0] question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-12 22:46:26 UTC
From: elvis@watserv.ucr.edu
Message-ID: <26099@galaxy.ucr.edu>
Source record: 40557

Hi,
I was wondering if some kind soul out there could help me with a problem.
I'm working on a program, and need to load in a config file. I'd like to have
this file in the same directory as the program, so I thought I would try using
argv[0], which I believe is supposed to contain the name of the program that
is being executed (I wasn't sure if it included the full path, or just the
program name, but thought I'd find out). However, argv[0] is always empty.
If I pass arguments to the program argv[1] - argv[whatever] work fine, giving
me the arguments that I pass to it, but argv[0] is still empty.
My next thought was to use the current directory, but that did not work as
I hoped either. I thought that the current directory should be the the one of
your top window at the desktop, but this does not seem to be the case.
Normally the path (when I use Dgetpath() (or is it Dgetdir()?)) is blank,
so that it goes to the root directory of the current partition (the drive is
correct, giving me the letter for the current window). All this leads me to a
few questions:
Am I doing something wrong with argv? Should argv[0] be the name of
the program?
Under what conditions does the current directory get set?
Is there another (better?) way to tell where my program is being run
from?
Any help would be appreciated,
Andrew Cullum (elvis@watserv.ucr.edu)

>incompatibly.

All of the co-processor add-ons I've seen are compatible with the Atari SFP004 specification, which is supported by the GCC library. In total, the GCC library implements floating point arithmetic 3 different ways - plain 68000 code, SFP004 compatible code, and native 68881 code (which is really only usable by 68020 or 68030-based systems).

Since it's now apparent that we can implement a Line-F emulator to allow any program to use the floating point instructions directly, the question now becomes - how do we specify things in the _FPU cookie? We need values that mean "no FPU, 68000 emulator installed" or "SFP and emulator installed" in addition to "no FPU code at all" and "FPU in coprocessor mode installed"...

You can be sure. Actually I am running a 28MB minix fs, where GNU-C
resides. This partition was installed using the ICD formatter. And of
course, it consists of 512byte-sectors.

>Sorry this wasn't included - My partition size is ~15Mb, so I didn't
>come across it. The reason is that 'minit.ttp' needs 512-byte sectors.

Well, actually minixfs also handles 1024 byte sectors, cause this is
what I use. It works great on my two ~60 Mb minix-partitions.
I partitioned the drive with hdx, thus I ended up with 2048 byte sectors.
"All" you have to do is edit the bootsector to give twice as many
sectors and half the size on sectors. (If you want to use it as a FAT-
partition, you'll also have to quadrople the number of sectors for FAT)
I then zero'd the partition whith HDX, and minit'ed them.

This has been working great for me and AHDI the last year or so.

Note that you'll have to have tos >= 1.04 to do this !

Cheers
Erling

>
> - Marco -

Well, the number one reason is that HE owns all COPYrights, and it is
his (and Atari's now) RIGHT to tell what is allowed and not...

As for why would this be done, probably because if you're compiling
it, then there's a good chance you're a programmer (at least enough to
know what to do with a Makefile), and so MiNT is really being tested by
other programmers. Releasing the executables says that this is a
product that is to be USED by all, rather than just TESTED by all...

Of course, no doubt I'll be clarified on the comments (no flames
please, just corrections!) but this is what *I* would assume...

MiNT has always seemed to have been a "beta" type of release,
in continual testing mode. MTOS is more of the actual product of
this testing. MTOS *will* be out with the American release of the
Falcon, and thus by then you will probably be able to obtain the
official "product" (either buy, if it's commercial, or copy if it's
released freeware)...

From: mgm@world.std.com
Message-ID: <C2DBvL.5D1@world.std.com>
Source record: 40569

I haven't tried reading argv[0], so I'm not sure about this. I'm sure different languages could treat it differently.

However, if you *just* want to read a config file, there's an easy way out. Just include the filename ONLY in the open statement, i.e. fopen("qwerty.dat","r"); - and the user will be responsible to make sure that the file is in the current directory when the program runs. Under normal circumstances (i.e. double-clicking from the desktop) it will be the directory the program is in anyhow.

Sounds like your ls.ttp was linked with the mint libraries before
patchlevel 25. Patchlevel 25 of the libraries fixed a bug in the
directory handling routines that sounds like the problem you
described. Since Emacs also accesses directories, it has the same
problem.

> I tried removing the memory protection by following the notes
>in memprot.c and setting int no_memory_protection=1; but when I

>this version of Mint need s a 68030 to run"!!!!!!

Humm, try commenting out the code that checks what kind of cpu you
have :-). I dunno the name offhand, but there's a call to the routine
right at the beginning of main(). I don't have the source right in
front of me, but I guess what's happening is one of the checks for
whether you're on an 030 is losing when memory protection is off.

> I also would like to know how exactly I can get at the screen
>directly from my programs,without being smacked by the MMU as I am
>trying to write a set of fast graphics calls that will probably live on
>Trap #7.

Is the MMU "smacking" you even when calling in supervisor mode?
Try wrapping your code in "old_usp = Super(0L); code ; Super(old_usp)"
but don't do this when installed as a trap handler (you'll already be
in supervisor mode while handling the trap)

> I really hope that someone out there can help me,

I hope my guesses help, I'm still on a cranky old STf so I may be way
off base on how the 030/MMU really work...

cheers,

The idea is if you aren't clueful enough to be able to compile the
system, you shouldn't be running a beta version of an operating
system.

MiNT versions after 0.95 are beta versions of MultiTOS and are
provided free in source code form as a COURTESY of the author, who
stuck his neck out for the rest of us to be able to even do this much.

PLEASE do not violate these terms, if you really need a binary version
go ahead and use the binaries for version 0.95.

Disclaimer: I don't speak for Atari, I don't speak for Eric, and I
only occasionally speak for myself.

808. MFM hard drive on ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-13 11:45:19 UTC
From: linda@cs.su.oz.au
Message-ID: <1993Feb13.114519.14160@cs.su.oz.au>
Source record: 40558

I have a spare 40Mb MFM hard drive (an old Seagate ST251). I would like to hook
it up to the atari. What products exist to do this (if any)? I realize there
is a problem in that the adapter will have to do arithmetic to translate the
sector number the atari gives to heads/cylinders/sectors etc, and thus will
have to be configurable for different drive geometries. Ugh. Any ideas?
Thanks,
David Monro

> I should know. :}

I'm quite sure DCFormat 3.02 *does* (optionally) do a verify pass; I always used to select verify on when I used it for formatting. It also claims, if it finds bad sectors, to mark them as bad. However, I've never been convinced that this actually does any good under TOS - anybody know?

John

815. Re: argv[0] question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-13 15:53:08 UTC
From: bobf@flint.geology.yale.edu
Message-ID: <1993Feb13.155308.9581@cs.yale.edu>
Source record: 40572

What ends up in argv[0] depends on the shell you're running and the startup code in your program (i.e. the compiler you're using). Some combinations of shell/startup code _do_ put the name of the program in argv[0]. I know that Mark William's shell & compiler do, and probably the GNU-stuff does, too.

816. Looking for RF modulator documentation

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-13 17:05:44 UTC
From: sjohn@zardoz.ece.cmu.edu
Message-ID: <C2ECtM.DAy@fs7.ece.cmu.edu>
Source record: 40566

I acquired an RF modulator box from an Atari ST. I want to use it in a project of mine, so I need some information about it. I figured out what about 1/2 the pins on the device do, but I'm still in the dark about the others.

The device in question is a small metal box approx. 2 1/2" by 3 1/4" in size with an RCA jack and a switch at one end and 10 pins for attaching the device to a PCB at the other end. The bag it came in has the following information:
PRS015
520/1040 RF Modulator
P/C: 000080
C/C: S-CONNECT

There's also a label with the designations C070491 and 163T on one side.

I'm looking for the pinouts and the electrical characteristics (voltage ranges, waveforms, etc) of the inputs, or at least a pointer to a source for such information.

Any help would be greatly appreciated.

Thanks.

- John Sasinowski

818. MAN and JOVE problems...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-13 21:06:57 UTC
From: dud@stein.u.washington.edu
Message-ID: <1ljnthINNr84@shelley.u.washington.edu>
Source record: 40568

After installing everything with the MiNT distribution kit, there have been a few quirks in my system that I've been trying to iron out. I use TCSH in TOSwin. Maybe someone out there can give me some enlightenment...

Until yesterday, MAN didn't work. It couldn't find the directory. I finally found out the problem was that I had "setenv MANDIR /usr/man" instead of "setenv MANPATH /usr/man" in my mint.cnf file. Well, now "man ls" works, but nothing else does! For example, when I type "man tcsh" or "man man" or "man jove" it says:

Formatting file. Wait...Aborted (sorry)

Everything except "man ls" does this. I can't understand it...

The other problem is with Jove (the Emacs clone). For some reason it tries to save the autosave file to "d://tmp/". I have my TMPDIR environment variable set to u:/tmp. I don't know how it gets to drive d, and I don't know what's up with the extra "/" in there. In any case, it can't create the file, so autosave is always aborted.

Any insight to either of the above problems will be greatly appreciated!

Thanks,

Dan Aylward

Hmm, I don't need them THAT up-to-date and installing a trap-handler seems
rather dirty to me. And it's not that much quicker than usgin Supexec I
should think. There's still the overhead of the TRAP-dispatcher.

IL> (I've been wondering lately if there's any standard for finding and

I don't think there is a standard, you're not allowed to grab trap-handlers
at all although some compilers (some Modula-2 compiler) install their
run-time-system in it. I hate compilers like that: even if you yourself
stick to all the rules your compiler will ruin it for you!

Well, I nead those variables quite often: once every go thru my main-loop.
The problem is that there's usually not much to do in the main loop so I'll
be doing a lot of Supexec's. And only doing it every 10th of a second won't
work either because I won't know when that has passed because one of the
things I want to know is the 200 Hz timer! :-(
Maybe only reading the stuff every x (10, 20, ...) passes is an idea......

Source record: 40583

I am not sure the directory an application is located in when you double-click on it can always be assumed to be the current directory for the application when it is executed from GEM Desktop... mainly because if you were to have the application in a window beneath another "topped" window, and you hold the right button down and do a double click (w/ left button) on it while it is in this "un-topped" window... it will still run.

> MiNT, why source-only distribution

I can't speak for Eric or Atari, but if I were to release something with a source-only redistribution limitation, it would have nothing to do with ensuring the users are "clueful enough" to use a beta product, and everything to do with support.

If the only binary distribution is the one I release, then I don't have to try to support a hundred minor variations on the basic system. But by releasing source, I could allow "clueful" programmers the ability to customize the system for their own private use.

(I like that word 'clueful', I have a feeling I'm gonna start using that a lot. It ranks right up there with another coinage I heard recently and instantly adopted: that blue gunk you put in the windshield washer reservior is "wiper juice".)

> current directory at program startup, finding argv[0], etc

Different TOS versions have handled this differently. On older TOSes, the current directory was that of the topped window if the program was started by double-clicking the .PRG file. If you used right-button-dclick to fire up a program in a non-topped window, that could confuse the program. Also, when you start the program by dclicking on a document for which the program is the installed application, the current dir would be the one containing the document.

I notice on the Falcon TOS (and maybe others) you can set which directory will be current by using the Install Application dialog.

When you're started by something other than the desktop (ie, a CLI, another program, etc) you can't really make any certain assumptions, although it is pretty common for the parent program to make the child program's directory current before starting it.

All this said, there is One True Best Way to figure out what directory a program was run from, but it is a wee bit tricky. The way is to call shel_read() right after your appl_init() call. If you were started from the desktop, or from an intelligent shell/application, the full drive/path/filename of your program is returned by shel_read(). But, there are some programs that don't put valid data in the buffer, and what you get from shel_read() is the data for the program that started you. So what you have to do is take the string returned from shel_read(), and isolate the program name from the end of the string. Compare this to your program name, and if they match, the data is valid, and you know you were started from the path indicated by shel_read().

The problem is, if the user has renamed the program file, this test will fail. Tough luck on the user in that case, I say. The other problem is that Atari never properly documented all this, so many programs don't put valid data in the buffer, which they could do by using shel_write() before the Pexec() call.

I cooked up a nice easy-to-use method of using shel_write(1,...), then Pexec(), then shel_write(0,...) to fire up a child program in a way that it could use shel_read() reliably. I even convinced Atari to publish the method (should be in an upcoming Developer newsletter). The problem is, the method turns out to be incompatible with MiNT/MultiTOS, because even though shel_write(0, ...) already had a well-defined meaning and usage, they decided to have it mean something completely different under MiNT. (Someday Atari may get a clue when it comes to enhancing a system in ways that don't conflict with existing practices.)

Anyway, the shel_read() method is very reliable if you expect to be run from the desktop. If the shel_read() method doesn't verify (the name in the buffer isn't your name) then you just have to fall back on using Dgetpath() and hope for the best.

> Line-F emulator, _FPU cookie

If you had a line-f emulator, wouldn't you just set the cookie to indicate a hardware 68881/2 using the coprocessor interface? The whole point of the emulator is to make it appear as though the hardware is there even when it isn't. (I'm assuming we're talking about a resident emulator.)

If there was a need to let programs know whether they're getting emulated 68881/2 or The Real Thing, then maybe a bit in the lower word of the cookie value should be defined. The docs I have indicate that the low word is reserved for describing software FP support. (I have this feeling that Atari has already done this, but I can't find my most recent newsletter.)

> me the arguments that I pass to it, but argv[0] is still empty.

To have something useful in argv[0], both your shell and your compiler's
startup code have to understand the ARGV scheme (which is described in a
file called argv.txt, which is available from many ftp servers). The ARGV
scheme basically passes the command line via the environment, which allows
for passing argv[0] aswell as passing command lines longer that 125 characters.

The content of argv[0] is dependent on the shell you use, so it does not
nessecarily contain the path of your program's location.

If your programs needs to read a config file, I'd suggest communicating its
location using an environment variable.

SS>Has anybody done a do-it-yourself upgrade on a 1040st with a single 4
SS>meg simm? My brother would like to do this, and thought somebody might
SS>have an easy upgrade.

This is not possible, because a 4MBit SIMM has only 8 data lines (the
normal ones, 16- or 32-bit SIMMs are quite expensive and difficult to
get!), but the ST requires 16 data lines (it's a 16-Bit-computer, right ?).
That means that you always have to connect 2 SIMMs to get 16 bits, so you
have to use 4 1meg SIMMs to get 4MB (you don't want to waste half of each
4meg SIMM, do you ?)

btw: do not use RAMs that are faster than 70ns (eg 60), this might cause
timing problems. The RAMs may be as slow as 150ns.

Use appl_tplay() to "replay" a mouse movement recording your program set up
before. Try appl_trecord() to find out how mouse movements are stored.

AND: Check for AES version HIGHER THAN 1.00 before doing so at runtime; the
appl_t...() calls didn't work there.

Well, I guess you have to make up your mind there.

Sys7 certainly isn't a case of plug it in, turn it on and it works. You _do_ have to spend days reading weightly tomes to work out how to make it do anything. You can spend exciting and joyous days discovering just how little of your favorite actually runs... and then hunt down a wonderful program that will let you have any number of different versions of the System/Finder to choose from when you boot...

There are applications which are simply incompatible with multitasking operating systems, full stop.

The one thing that confuses me, though is that you should know this...?

>any around?

Look on obelix.icce.rug.nl in pub/tom/jove/MSDOS. It may not be the documentation to the real JOVE, merely to Tom's Version of JOVE, but it comes close. Besides, now may be the time to switch to Tom's version, which has been approved of by Jonathan Payne.

I just noticed we haven't got any Atari version up there (strange, because both Tom and I do not have a DOS machine at home), so I will put one up for grabs tomorrow. There are sources (in pub/tom/jove) available for platforms, incl. TOS/DOS/UN*X (SYSV, BSD, HP-UX, SUN, NeXT, and more)/VAX-VMS and more.

> to the currupted copy and how?

You can use the backup copy, but it will probably not help
you much because it's probably (at least) the root directory that
got trashed, and you don't have backups for it on your disk.
Before copying or "repairing" anything, you should first find
out what EXACTLY was overwritten: The root directory only? Parts
of the data space? One of the FATs or both FATs? The boot
sector? Most data is lost when people try to repair things
on disks that aren't broken, so my advice is to get the facts
first before trying anything. If you need help, feel free to
contact me via e-mail.

>Is there anything I can do to get these programs to run ok?

Anything which accesses a directory must be compiled with a very recent
version of mntlib as the older ones had a buggy readdir() function, which
crashes programs. It is obvious that these programs use the old version.

> I tried removing the memory protection by following the notes

Similarly Lattice C. The manual defines (my memory's rusty) a floating
point mode (is the FPU memory-mapped onto the CPU address space???)
which works on SFP004s and Mega STEs and TTs and (prob.) Falcons.

This means of course that only one program can use the FPU at a time,
so no DAs. Is this a seriously dumb idea or what?

I hope I'm wrong about all this, but I recall warnings not to use FPUs
in 'resident' programs in the Lattice docs.

```
k>I have gotten the jove executable from some German ftp site
k>(athene.uni-paderborn.de, if I remember that correctly). However,
k>the archive contained only the executable itself, no docs. Are
k>any around?

The MiNT distribution kit contains JOVE *with* docs. But then I had problems
when I tried to nroff them. I haven't seen a *full* implementation of nroff for
the ST. Even Groff failed with the JOVE docs (or I just failed with Groff :-( )

But then there's a lot of docs for the [Micro]Emacs out there; that should help
a lot since JOVE is just another Emacs clone (quite close, as far as I know).

Cheers,
Andreas

This is most likely a BIOS problem. I would guess that you have an AMI BIOS
in your PC at work [works fine with many disk formats] and a Phoenix BIOS at
home [complete crap].

I have never seen a DD vs HD drive problem on 3.5" disks though. I am familiar
with the problem you described on 5.25" disks, but not on 3.5" ones.

Maybe your HD drive at home isn't jumpered properly and attempts to detect
density by reading in both densities instead of checking the HD hole?

Source record: 40499

This reply is only useful to you if you're running the minixfs
filesystem. But I'm pretty sure you are, or you'd not have the
problem...

> Until yesterday, MAN didn't work. It couldn't find the directory. I
> finally found out the problem was that I had "setenv MANDIR /usr/man"
> instead of "setenv MANPATH /usr/man" in my mint.cnf file. Well, now "man
> ls" works, but nothing else does! For example, when I type "man tcsh" or
> "man man" or "man jove" it says:
>
> Formatting file. Wait...Aborted (sorry)

The MANDIR/MANPATH thing is strange - I was under the impression that
either worked fine...

The reason that ls works is that it is in the /usr/man/cat1 directory.
which is where the pre-formatted manual pages go. Basically it just
does a ...

cat /usr/man/cat1/ls.1 | less

I think you'll find that there are files in the cat1 pages for all
the files you've tried to 'man' that consist of the message you've
got above. Therefore nroff is failing. The reason AFAICT is that the
name translation isn't working. If you were to try to do it manually
(no pun intended, honest guv) then you ought to get the error that
nroff is coming up with printed to stdout. So, try...

nroff -man /usr/man/man1/jove.1 | less

I *think* you'll find that it says something like...

nroff: can't find formatting macros/usr/local/lib/nroff/TMAC.AN

I haven't a solution to this at the moment. What might be worth
trying is to install the mfsutl.zoo package in Updates. This is
supposed to be for 'make', but the same things may apply.

*** PLEASE BE SURE THAT THIS IS WHAT YOU WANT TO DO *** There are
problems with the general purpose tools like cp, rm, mv if you do
this. There are replacements in the subset, but it's still a pretty
drastic step. The replacement utilities will probably NOT work if
you ever decide to go back to your current setup. They will probably
NOT work on TOS filesystems either. They might work if you do a
cp /a/MYFILE.TXT myfile.txt
for example, but there is no built-in support for 8+3 munging etc.
Basically these are the bare-bones unix utils.

The main problem is the harmonisation of the two filesystems. What
does everyone think ? Should I drop support for the TOS fs stuff and
make this a minixfs-only thing ? How many people use the TOS fs now
anyway ?

Simon.

849. Re: 38400 Baud problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-15 14:39:02 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <C2HvD4.7LB@hermes.hrz.uni-bielefeld.de>
Source record: 40501

The problem is that the ST is simply not fast enough to fetch data bytes from the serial port if this is run at these high speeds... Now before you start flaming, take a look at this: Suppose you're talking about an "normal" 8 MHz Atari, so a clock cycle is 125ns. Further suppose you're running a 38400 Baud connection with 7 data, 1 start and 1 stop bits, so each transfered byte is 9 bits long. At a maximum you can transmit 4266 bytes per second, sure you'll never reach this, but let us suppose this one too. The 6850 used in the ST to run the MIDI & IKBD port, just as the MFP running the serial port can't buffer any more than just one byte, and after each byte they raise an interrupt to make TOS fetch this byte and put it anywhere. So there are 4266 interrupts per second, one every 234 microseconds, or to say it in other words, there's an interrupt every 1875 clock cycles, as you can calculate from the above. Now the 68000 uses far more than one clock cycle per instrunction, lets say 8, some use less, some use more, doesn't matter. So the CPU is able to do 234 instrunctions before another incoming data byte destroys the older one. Let's further assume that TOS needs another 100-150 instrunctions to deal with the interrupt. And there you are, you've just got up to 100 machine instructions left between two incoming bytes and want to display them in a GEM-Window?

The numbers mentioned may not be correct for you're Atari (I've got a 16MHz one, doubling the spare time), but they should clearly show that the CPU is almost completely busy with these high serial ports rates. On a TT or a Falcon you may program the serial ports in a DMA based way, that's faster, but on any other ST's not :-(

I think evnt_multi tells you the shift key status when it returns with a mouse
click event. You should not really be detecting mouse clicks in any other way,
but if you are you might as well use Kbshift which is either a Bios or Xbios
call.

Rather unlikely. The worst case for the interrupt handler is:

```
Check which interrupt
branch away if not serial
copy byte into queue and advance pointer
branch over if pointer doesn't need resetting
reset pointer
clear interrupt
```

That is 6 instructions, and I don't think you really have to check it is the
correct interrupt or clear the interrupt mask afterwards. Call that 50 cycles,
+ 50 for the exception overhead = 100 cycles absolute maxiumum.
That gives you 1700 cycles free, less time for VBL and HBL handling. This
would be enough to write text to a byte alligned window using custom routines,
just supposing it were possible to read 4K a second.
The real problem is the speed of Bconin which goes through a trap dispatcher
which takes a VERY long time. However, since it is possible to get/set the
address of the serial buffer you can probably write code that reads data
directly from the buffer.

>interrupt. And there you are, you've just got up to 100 machine instructions

As I said, the real problem is the speed of Bconin so having DMA serial ports
is going to make FA difference.

852. SuperCharger / HD woes

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-15 17:02:49 UTC
From: cleaves@ctron.com
Message-ID: <6878@balrog.ctron.com>
Source record: 40503

Hello,

I've got a problem with my SuperCharger and a new(used) HD. My old configuration was: 1040STf, Megafile 30, SuperCharger, Spectre GCR. Everything worked just dandy, the Spectre had partition E: and SuperCharger had F: but this left little space for any machine on the HD. So I bought an 85 meg hack from someone. This drive is a Seagate 1096 with matching controller. It has one DMA cable, wired directly to the controller (or drive, it is difficult to tell.) No other ports, save a female DB25 that is not connected inside the HD. SuperCharger likes to be the last device in the chain, now it cannot be. So, the manual says "Make it the first" I did and this causes HD boot problems and when I can boot, the SuperCharger software says that the SuperCharger is not connected when I try to boot DOS. All the device addresses are different, no problems there. The SuperCharger still works if the HDs are totally removed. I do notice that when trying to boot DOS, the Data light on the SuperCharger used to blink and now it is the new HD data light that blinks and I can hear the drive doing something. I AM SURE that the device addresses are different. Megafile 30 = 0, Seagate 1096 = 1, MAC partition on the Seagate is recognized as 2, and the SuperCharger is 3 (factory default). I am using AHDI5 with both HDs and everything else seems to work fine. Any ideas about the problems/ solutions? It is not a necessity for me to use SuperCharger, it was when I was in college, but now it is just sort of an extra bit of fun (though I still use Borland C++ on occassion.)

Please send any ideas about this. Otherwise I'll be taking offers from any prospective buyers. Will want to include Turbo Pascal 6.0 and C++ 2.0 in the price.

Also... AHDI5 tells lists the names of the drives on boot-up, it recognizes the 1096 ok, but it doesn't know the name of megafile, I know it is an Adaptec, and IT IS an Atari drive, why doesn't the Atari software recognize it?

Thanks,

Stephan

>Is there anything I can do to get these programs to run ok?

These programs were probably compiled with an old version of the MiNT
library (patchlevel <25). Recompile them with patchlevel 25.

> I tried removing the memory protection by following the notes
>in memprot.c and setting int no_memory_protection=1; but when I
>recompiled this,I got a version of Mint030.prg which printed "Sorry,
>this version of Mint need s a 68030 to run"!!!!!!

There is buggy code in the file main.c that assumes that if memory
protection is off, you're not on a 68030. Just comment out that code
(look for where the message is being printed, or for the define ONLY030).

> I also would like to know how exactly I can get at the screen
>directly from my programs,without being smacked by the MMU as I am
>trying to write a set of fast graphics calls that will probably live on
>Trap #7.

The screen is in globally accessible memory, i.e. all programs can read and
write to it without any problems. So you don't need to do anything
special.

Regards,
Eric

In article <7b19bc00@p11.f202.n281.z2.fidonet>
p11.f202.n281.z2.fidonet!Marco_Fris@nextjk.wlink.nl writes:
>I don't quite get this. If someone agrees that his sources can be spread
>around, what's the problem with distributing executables? I don't mean to
>criticise anyone, but I just can't figure it out.

There are a variety of reasons:
(1) It's one way of ensuring that everyone can get the source code (in this sense it's similar to the restrictions that the FSF places on distribution of GNU programs).
(2) It's a way of clearly indicating that no support is being provided, and of making sure that only reasonably computer-literate people (i.e. people who can run a compiler) use the program. Also, it means that people can quickly fix the variety of bugs which are sure to pop up (see all the other MiNT 0.99 messages in this group :-)). If you only had binaries, you couldn't do this.
(3) From a cold, heartless capitalist point of view: (1/2 :-)): people who don't know enough to compile MiNT can't help either Atari or me to fix bugs, and can't enhance the system in any way, and so there's no point in giving anything away to them.

MultiTOS will be released very soon (in fact there may already be Falcons shipping with MultiTOS; I'm not sure). If someone wants a binary only version of MiNT they can use the one that comes with MultiTOS. I get paid to support that version. I don't get paid to support the freeware version, and have very little time to do so. That's the major reason why I insist on source code only distribution; that way I know for sure that everyone that has freeware MiNT (past a certain version, anyway) has source code and knows how to compile it.

These are all my own opinions. Atari no doubt has its own views on the distribution of MiNT, but I'm not authorized to speak for them.
They have authorized source code only distribution, and while perhaps some people might wish for more, I think (personally) that this is a remarkably generous gesture. Not many companies give away source code to a major component of their operating system.

Eric Smith ersmith@netcom.com ersmith@atari.uucp
I do *not* speak for Atari. Nor would I want to :-).

855. Re: Co-processor chip capabili

Message-ID: <A1267@K.maus.de>
Source record: 40506

h>Since it's now apparent that we can implement a Line-F emulator to allow
h>any program to use the floating point instructions directly, the question
h>now becomes - how do we specify things in the _FPU cookie? We need values
h>that mean "no FPU, 68000 emulator installed" or "SFP and emulator installed"
h>in addition to "no FPU code at all" and "FPU in coprocessor mode
h>installed"...

What's the problem? It doesn't matter whether a SFP004, a 68881/2 or a FPU
software emulation are present. All we (the programmers) need is a gurantee
that _every_ program can use the Line-F inline code or at least a library
containing Line-F codes. If no coprocessor exists, simply install the
emulation package. If a SFP004 is present, install a handler for it. If a
68881/2 is present, do nothing at all. And if a 68040 is present, then install
the Motorola Software-Floating-Point-Package (price for Atari: 5000 US$).

Bye,
Robert

I could answer all your points here, but it's hardly the right group. Please read up on Plan 9 -- you can get the documents by anonymous FTP from research.att.com in dist/plan9doc.

To whet your appetite, a little something from Rob Pike on 8 1/2 (the Plan 9 window manager, named after Fellini's film of the same name) follows.

Warning: this is *long*. Hit 'n' now if you're not interested.

---- cut here ----

The movie for which 8 1/2 is named is, of course, Fellini's 8 1/2.
Actually it's not named for the movie so much as it acquired the same name for the same reason as the movie.

8 1/2 is certainly not a text-only window system. It is implemented above bitblt (a.k.a. RasterOp) and so is capable of general bitmap graphics. It also has efficient primitives for line drawing, character strings, and so on. It supports multi-font text in a representation of Unicode, a 16-bit character set. Plan 9 has a number of graphical applications that use all these features. My favorite is an interactive astronomical catalog and atlas.

8 1/2's windows are virtual terminals, not objects created by applications (although an application can certainly create windows). Instead, applications are run in existing windows, perhaps created just for them. The details of this process are described at length in the 8 1/2 paper (see below).

By default, 8 1/2 does not support cursor addressing in its windows, although we have a terminal emulator that runs in a window to allow us to run (remote) Unix applications such as rn. As a related topic, Plan 9 has no software based on cursor addressing, for example vi or emacs. On the other hand, the default terminal program, analogous to xterm, allows general cut-and-paste output of the typescript, just like the text editor, sam.

Although the paper about 8 1/2 states otherwise, the system now supports 8-bit color including color maps and all that. As predicted in the paper, adding that support required a modest amount of code: about 200 lines. 24-bit color would take more work but I still expect the system could handle it gracefully with little more work.

Because it is implemented as a file server, 8 1/2 supports remote graphics: all that is needed is to export the files it serves to a remote machine. We do this all the time.

In Plan 9, X is just an ordinary (although enormous) application. It runs in an 8 1/2 window, usually on a remote machine with a lot of memory and no bitmap display, saving one the trouble of devoting one's workstation to X in order to run an X application.

The system is very fast. We have a sort of tool that creates a new window running a shell at the click of a button. On a MIPS Magnum no one (except perhaps Art Tatum, and he's dead) can repeatedly hit the button fast enough to get ahead of the window system. That means it takes less than a tenth of a second to make a new window, which is how it should be: I like to think of windows as scrap paper to be grabbed when needed and discarded when not. X windows take too long to make and are too fussy to manipulate to offer that kind of dynamism; X screens tend to be laid out once and left alone (hence all that customization).

If you wish to read more, there is a set of early papers about Plan 9 available by anonymous FTP from research.att.com in dist/plan9doc. The paper about 8 1/2 includes a figure that shows that, although the user interface is uncluttered by the gewgaws that usually attend bitmap displays, the system is capable of general bitmap graphics. This fact is also implied by the running of X as an application.

I have considered porting 8 1/2 to Unix but have not been able to find a clean, portable way to do it. The system depends critically on two things: per-process name spaces and a portable representation of the bitmap display. These are not available on Unix.

However, Plan 9 is being made available. Two universities -- I'll let them name themselves if they so choose -- have the system up and running under a sort of beta-test agreement. We are working towards a more widespread, academic only release. I won't predict the actual date but I hope and believe it is of order a few months from now. The arrangement is much like the original Unix release. AT&T is unlikely to support it as a product soon as it would compete directly

with System V.

Rob Pike

>This is sometimes called a pipe. Mint/MultiTos provides pipes for
>output redirection and it should be possible to do something like
>this.

yes but you will probably have to write a decent /dev/midi driver first
if you want these things to be fast enough. (and they will have to, midi
has no handshaking...) on a mega STe with mint i already had to do
hacks* to get full 19200bps over the modem port, without any pipes...
on midi its 31250bps and the current driver does not even have a send
buffer, and loses incoming data when you move the mouse. (unless they
have fixed that for the falcon.)

no i'm not saying its impossible, but it has to be done right. :-)

>Erlend.
happy hacking...
Juergen

*: if you want to look at my hacks, i recently managed to ftp the stuff
to atari.archive, look for tuu103d3.zoo in Mint or Newstuff... (diffs
for Taylor uucp for mint, or tuu103_3.zoo with binaries.) the main hack
is it bcopy()s most data out of and into the drivers buffers directly
instead of using mint's calls that still do it in loops of one character
at a time. result is a uucico that can send and receive >1900cps while
according to `top' taking some 5-8% CPU time... (with 1K packets,
window 7, and 8K send and receive buffers.)

PS: uucp is the `classical' method to transport usenet news and mail
over modems, for those who don't know... (and taylor uucp is just that,
i.e. you still need some mail and news system to use it.)

a>
a> Are you refering to the mmu/blitter ? If so then this was only the case
a>with some STEs. Otherwise, you may be right.

No, I'm referring to MMU and GLUE, which were separate chips in STs and one
single chip in STEs. Later on, they integrated the blitter into that chip, too.

The DE (Display Enable) signal is no longer accessible in ALL the STEs around,
so that the Overscan hardware cannot work.

C>device
C>(only under GDOS for this one) instead of a screen device and let the stvdi
C>code
C>write out as usual. Can anyone see any problems with this ?

Well, don't expect Ghostscript to actually _draw_ the image using VDI.
I suppose it calculates the image in memory and then does a single vro_cpyfm()
into the window it opened before.

Watch the stvdi window at scrolling time: There is no drawing activity, all the
stuff appears instantly.

|> Steve Hanka
|> shanka@eyring.com
|>

I've done the same thing before, although it was quite a while ago...
To add your other two partitions:
1) Select, single click, the disk C icon.
2) Select the Install ICON menu selection.
3) Change the Drive letter to D
4) select OK.

Drive D should now be accessable.
Repeat the above for your E partition.

I may have the listed the wrong selection in step 2 but it is there.
I have been spoiled by the INSTALL DEVICES menu item in TOS 3.06

<message deleted for $ reasons>

You failed to mention your type of system but for the most part it does not matter. Atari's labeling of DRIVE 0 & 1 Selects are not really accurate. If you a an original 520, external floppy variant, then it is labeled correctly, otherwise forget it.

What Drive 0 select really means is "next drive to be connected in the daisy chain". Drive 1 select means the "second drive in the daisy chain." A drive is responsible for routing Drive Select 1, on its input, to Drive Select 0, on its output. Since most systems are shipped with an internal floppy, only DS0 is connected to anything on that port. Therefore ignore DS1.

Now PC drives are ALMOST ALWAYS setup as drive 1 not drive 0, and from your description that is what your drive is setup as. So you want to connect Atari DS0 to Floppy DS1, or DS0 and move the jumper. So I think your initial cable was probably OK.

Now for the ST to actually read this floppy you will need to change the floppy step rate from 3ms to 6ms. There should be a couple of PD programs to do this. Also, NeoDesk allows you to configure whatever speed you need.

I hope this helps.

Source record: 40519

```
>> [reading system variables]
> I need hz200 and carrier detect

Hang on a sec...if those are what you need, why not just install your own
handlers in the appropriate vectors. Use standard hook-and-chain handlers
that let your program see the interupt and then pass control on to the
original system routines. For the 200hz, you just increment your own
local timer variable, and for the CD, you do whatever it is you need to do
(probably record the changed status into a local variable).

> Installing a trap handler seems dirty.

Not at all. Overkill for what you need, but not at all dirty.

> Still the overhead of the trap dispatcher.

No, there won't be any dispatcher, your handler will be invoked directly
and immediately, that's why using a custom trap handler has an advantage
over using Supexec(). Supexec() does have a fair amount of overhead in
terms of decoding the function number, saving/restoring registers in a way
that allows BIOS reentrancy, and so on.

> you're not allowed to grab trap handlers at all

Where ever did you get that notion from? The Atari docs state quite
specifically, "The ST makes use of four of the sixteen TRAP vectors
provided by the 68000. All other traps are available for applications."
(HHG page 28.) It is also quite legal to insert your own routines into
the exception and hardware interupt vectors. Indeed, I wish more programs
would do so. I would much rather have a program tell me "An unexpected
condition has caused a bus error, your work-in-progress will be saved",
than to just see some bombs and then the desktop. Nowadays, most
everything I write more complex than a quick-and-dirty uses custom
exception handlers to make a graceful exit from the program, saving
whatever work of the user's I can if that's appropriate.

I have been trying to get Mint 0.99 to run on my Atari unsuccessfully now for a couple of weeks. I finally found out what was wrong. So to those of you whose computer hangs just after displaying the Mint welcome screen you can try the following: Don't run any programs in your profile.ksh or kshrc.ksh files. For some reason Mint (or more likely ksh, as I'll explain) will hang when it tries to run the programs. The reason I believe it is ksh and not Mint is because when you get Mint to run as described above, it acts very, very strange! By this I mean that as soon as you run a command the shell instantly forks and and runs your command in the background, let me tell you it's real fun when you try to run emacs and it forks and put's it in the background and you still have a shell prompt accepting input at the same time! Now on the bright side, if I use sh as my startup shell all is well and Mint 0.99 works great!

I hope this helps some people who I know are experiencing problems with Mint(or rather ksh) hanging.

PS: Would it be possible to get the person who has the source to ksh to compile a new ksh version with all of the new libraries and such?

Source record: 40523
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm looking for 8-bit sample playing code using the sound-chip. I want to add the Mac samples from NetHack 3.1 into the Atari ST version. The sample playing code that I have is petty poor...

C preferred, or 68k assembly. The sample can take over most of the computer if necessary since I'll be loading/unloading the samples when necessary to conserve RAM (for those 2M users); I don't need code that will play a sample in the background.

We got the sample playing code from ReSound at atari.archive and re-wrote it in MadMac assembler; we can call it from C like this:

```
int spl_play( char *buff, long buff_length, int sample_speed );
```

Any suggestions? Any _donations_? :-) Email me if you'd like to help make the Atari ST version of NetHack 3.1 even cooler...

Thanks!

869. Non-snapped RSC objects... PROPOSAL

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-16 03:40:09 UTC
From: warwick@cs.uq.oz.au
Message-ID: <12067@uqcspe.cs.uq.oz.au>
Source record: 40524

When using a RSC editor, I always want to align objects freely, not snapped to the character positions. However, if this is done, GEM/AES converts the pixel positions (and sizes) to "character position + pixel offset" pairs. When such a RSC is loaded, the "character position" is scaled up by the current character size (eg. 8x16 for STHigh, 8x8 for STLow and STMedium), then the "pixel offset" is added.

I think that is STUPID.

Why not store the "pixel offset" as a *fraction* of a character position, then scale that accordingly.

Rarely do non character-aligned objects look very aesthetic when loaded in a resolution of differen char-size than that it was defined in.

BUT we don't even need to change GEM/AES in anyway... I have implemented the following proposal in GEM++, and it works fine:

_____ PROPOSAL _____
____FOR DIALOG BOXES____
___ACROSS RESOLUTIONS___

When dialogs are loaded, they should [optionally] be traversed by the application, and all object positions and sizes (ob_x, ob_y, ob_width, ob_height) should be rescaled (after the GEM/AES rescale) to use pixel offsets scaled by the current character size, rather than the raw pixel offsets.

To do this, simply have two value "rscw", "rsch" that are the character width and height of the characters used when the RSC file was created (eg. if created in STHigh, rscw=8, rsch=16), then to "refix" a tree, find the current AES characer size, using:

```
graf_handle(&aesw,&aesh,&j,&j); // j is junk
```

then, traverse the tree (using some form of MapTree), changing each ob_x, ob_y, ob_width and ob_height as illustrated by the following code:

```
int pixeloffset = ob_x % rscw;
ob_x += offset * aesw / rscw - pixeloffset;
```

The effect of this will be to more accurately adjust the positions and sizes of objects for different screen modes. With the advent of the TT and Falcon screen modes, this is becoming a more important issue. For example, an object of 30 pixels high (1*16+14) designed in STHigh or TTMedium will be 22 pixels high (1*8+14) in STLow or STMedium - ie. from almost 2 characters high, to almost 3 characters

high. Using the above technique however, the object would be 15
pixels - almost 2 characters high.

Notes
- menu forms should not be traversed, since GEM treats them
specially - giving a special height to Titles.
- applications that use "form_fix" [is that what it's called]
to rescale objects could either do that, then this
traversal, or simply use a simplified version of
this traversal.

874. PC-relative adressing with gas

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-16 09:32:03 UTC
From: kuehn@math.uni-muenster.de
Message-ID: <1lqcajlNN185k@obelix.uni-muenster.de>
Source record: 40529

```
I am currently having the problem how to get the gnu assembler
to put in the right offset when I am using PC-relative adressing.
I think of code like that:

_old_vector:
.long 0 | here the old vector is put in
_new_entry:
| here do some checks and other things...

do_old:
movel _old_vector, sp@- | here I want it pc-relative (speed!)
rts

I know that a statement like movel do_old-_old_vector(pc), sp@- does
NOT work, because the pc is about 2 bytes further at the time when
relative adressing is executed.

Thanks in advance

Ulrich

What exactly do you call a "Winchester Drive"? If you mean a drive with
a ST506/412 bus, you need a controller that converts ST506 to SCSI.
An Adaptec 4000A or 5500 would do that for MFM drives, an Adaptec 4700
for RLL drives.

> - and more importantly, is it 32-bit?

It is 16-bit. It will be of use in games and is acceptable but not as powerful as the Amiga blitter I'm afraid (just fact - I've got no problem with that - I develop for and own both Atari & CBM products) if it's anything like the STE blitter that is.

>
> 2/ The hardware scrolling on the Falcon hasn't seen much light..
> - WHAT exactly can it do?
> - and is it of any use in games?

I presume it is the same sort of thing as the STE facility in which case it is of some use but I personally am not a great fan of hardware scrolling facilities on either the ST or Amiga.

|> Andy MacCormack, aka armless, aka arjm@uk.ac.ed.dcs
|> "I am not ashamed of the Gospel of Jesus Christ for it is the
|> power of God to salvation of all who believe."
|> --

Err. Depends what language you're using, but the routine is in BIOS.

In GFABASIC,

shifts& = BIOS(10,-1)

in C,

int shifts = Kbshift(-1);

in Assembler,

move.w #-1,-(sp)
move.w #10,-(sp)
trap #13
addq.l #4,sp
[answer in D0]...

This gives a bitmap as follows (might be wrong, but experiment!)

Bit Description
0 Left Shift
1 Right Shift
2 Control
3 Alternate
4 Caps Lock (whether it's on or not!)
5 Alt-Insert
6 Alt-Home

If it doesn't work then maybe it's BIOS(11,-1) but I think it's right!
BTW you can set the shift keys by replacing the -1 (eg BIOS(10,%10000) in GFA
will set the Caps Lock key...

Hope that helps!

David.

>have an easy upgrade.

You cannot use a single 4Mbyte SIMM because the ST's memory is 16 bits wide,
and the SIMM is 8 bits wide - thus you need to use 4 1Meg SIMMS for 4MByte.
This is still relatively easy - see me file 2_5ram.zoo on aaue for details.

|>
|> IMHO a postscript to .GEM file convertor would be quite useful to the world

I wrote the GEM-IMG driver for GS. When I did this I talked a lot with Tim
about a GEM-metafile driver. We came to the conclusion that a metafile driver could be
possible. I wanted to write one but then I canceled this project because my study took a
lot of time. Maybe I will try to start it again.
If you want to know more about GS talk with Tim. You will find his email within
the sources.

886. GDOS to Postscript

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-16 18:06:27 UTC
From: bossoj@aix.rpi.edu
Message-ID: <j1#4zh@rpi.edu>
Source record: 40441

I/m sure this has been asked before but, I am looking for a way to route GDOS output to a postscript _file_ so I can take it to another machine and print it on a postscript laser.

I have seen discussions on Timework's DTP using poscript output, but I don't know where to get a Postscript driver, and what types of fonts I will need.

Thanks.

Joe

>(I speak for myself)

Most likely your 360K disks _do not_ have an IBM campatible boot sector
(which Roger's seem to have!). This is due to the TOS version: ones
before 1.4 did not make true IBM compatible disks. What you need
is find a program such as DC Format that will let you write a new
boot sector to your old disk, and then DOS should read them.

There used to be a reason for doing this, when floppies were expensive.
Now, keeping bad floppies is just stupid, they're so cheap now. A good
formatter will tell you immediately of a write failure, and you then
should proceed to frisbee the disk.

(I know someone out there is gonna make me eat my words on this topic, but anyway...) It would be a nice idea to let MiNT know if the FPU is real or being emulated, so it can know whether or not to save/restore the FP registers on a context switch. Ideally, there would be a way to trap all FP activity, so the OS can ignore the FP registers if the current process doesn't use them. (Right now, if MiNT sees that an FPU is present, it will always do a save/restore on every switch. If the current process doesn't use any floating point instructions, then one set of save/restores can be omitted.) In a software emulator, the FP registers have to be faked in normal RAM anyway, so they might as well just operate directly out of the process' register context, thus also eliminating a save/restore step.

:-(Unfortunately, it doesn't always work when scaling to a smaller
resolution, since information can be lost when the "offset" is larger
than the current character dimension. Looks like a new version of
rsrc_load() is required. [see companion post]

894. How to write new verison of rsrc_load()... kosher?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-17 01:35:21 UTC
From: warwick@cs.uq.oz.au
Message-ID: <12076@uqcspe.cs.uq.oz.au>
Source record: 40448

I want to write a new version of rsrc_load(). One that doesn't do the "character coordinate to pixel coordinate" translation - because I want to do it myself in a superior way [see companion postings].

However, I want to write the rsrc_load() in the most kosher way - so that I won't be so likely to have to change my code if a new RSC format (and compatible new RSC editors!) arrives.

Any ideas?

From: EENG6826@RyeVm.Ryerson.Ca
Message-ID: <93047.230621EENG6826@RyeVm.Ryerson.Ca>
Source record: 40449

Make a backup and then try using DLII024.ARC. If that doesn't work,
try reading the disk on a different computer. I had the same problem
because my disk drive broke and I had to replace it, the new disk
drive (Panasonic 1.44Mb) wasn't able to read a couple of old disks.
I tried reading them a few PCs and no go, until I found a PS/2 that
was able to read every floppy without problems (Complain all you want
about IBM prices, but at least it works!).
So try reading the disk on different computers.

Carlos Varela

What I really want to do is output _text_, not necessarily graphics.
The GEM to Postscript converters I've seen only work with graphics.
What I realy want is the postscript driver for GDOS (If I can get it
legally without having to buy TW DTP!).

: I need some help building a cable to connect a Nanao [Eizo in Europe]
: flexscan 6500 grey scale monitor to the TT030 for high res ECL 1280x960
: output. I do not know much about ECL monitors so I did not want to build
: the wrong cable an destroy the monitor, I have the pinout for the TT and
: the monitor. They are :

: ---------------------------------------------------------------------------
: TT030: Pin Signal | Monitor: Pin Signal
: 1 Red | 1 ECL + (MSB)
: 2 Green | 2 ECL - (LSB)
: 3 Blue | 3 ECL + (LSB)
: 4 Mono ECL out + | 4 Open
: 5 Ground | 5 Hsync
: 6 Red Return | 6 ECL - (MSB)
: 7 Green Return | 7 Ground
: 8 Blue Return | 8 Ground
: 9 Mono Detect (input) | 9 Vsync
: 10 Ground |
: 11 Open |
: 12 Open |
: 13 Hsync |
: 14 Vsync |
: 15 Mono ECL out - |
: ---------------------------------------------------------------------------

: It is clear that the cable should be at least

: TT End Nanao End
: ------ to ---------
:
: 5 7
: 10 8
: 13 5
: 14 9

: But I don't know where pins 4,9,15 on the TT port should go to on the Nanao
: port? Any help would be appreciated.

: Cheers,
: Scott Kolodzieski

You want to connect the grey scale monitor to work in TT high res mono mode correct?

Connect tt port pin 4 to monitor 1 and 3
connect tt port pin 15 to monitor 2 and 6
```

TT port pin 9 should be connected to ground to tell the computer to switch to mono.

The monitor you have got as it only has MSB and LSB inputs must be 4 shade greyscale

EXL is a logic standard where you transmit a logic signal AND the inverse of it (the + and - denote this). This method reduces the effect of interferance.

902. Query about driving SLM804 Laserprinter

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-17 13:46:31 UTC
From: neil@luna
Message-ID: <C2LI9L.Lzn@compsci.bristol.ac.uk>
Source record: 40457

We have a requirement to have direct printing control for the SLM804, we have manual for driving this printer and that it is connect to the SCSI interface.

The problem we have is acessing the SCSI from within a running program.

Can anyone (by e-mail please as I don't normally subscribe to this group) give us a hint how to access the printer via the SCSI.

Many thanks

Neil Davies

903. F030 - Some technical comments from a demo coder....

Newsgroup: comp.sys.atari.st.tech

From: Craig.Graham@newcastle.ac.uk
Message-ID: <C2LIHL.vE@newcastle.ac.uk>
Source record: 40458

This is another post as a favour to Griff of Electronic Images (who only has
read access to the internet).

The Falcon : A programmer/demo writers view!
(and Falcon030 vs A1200!)

Since I have programmed the Falcon I thought I better clear up some details regarding the
machines hardware.

The Blitter

The blitter on the falcon is basically a double speed (16mhz) version of
the STE blitter, which basically means that it is totally redundant. The main
problem being that the processor is STOPPED when a blit is executed (or the
blitter can be run concurrently with the processor, the bus being shared in
64 cycle segments). An STE can move about 1.6megabytes per second with the
blitter, so a Falcon blitter can move about 3.2megabytes per second, but this
locks out the cpu, not allowing interrupts and isn't really very useful.
Using the 68030 in the Falcon (in 320 * 200 true colour mode) you can move about 10
megabytes per second (or about 200k per vblank!) so why bother with the blitter. Since the
030 has a barrel shifter and data/instruction cache then any screen operations you want to
do (sprites/scrolling etc) can be acheived using the cpu in about half the time it would
take the blitter in hog mode.
Example:
In true colour mode 320*200, I wrote a texture mapping routine using the030 that drew a
texture mapped rotating cube at 25 fps(the cube was 190 pixels high).Now trying doing that
with an A1200! (oh i forgot the A1200 can only have 8
bits per pixel and has no byte/word pixel mode! Don't be fooled by Amiga people telling you
how wonderful the A1200 blitter is, because its not!)

Sound Hardware

The sound hardware on the Falcon is wonderful. The Protracker player
(now at atari.archive.umich.edu) I wrote for the Falcon plays modules at 50khz
using 15bits per channel(two 16bit stereo channels). For anyone wanting to
know the technical details, the player uses 32 bit interpolation and an 8bit
to 15bit volume conversion table and takes about 30-35% cpu time, but i guess
when people learn to use the DSP it will take about 3% cpu time! The sound
quality is great, better than any Amiga.

A friend of mine (Douglas Little of Photochrome fame) told me a really
neat trick using the sampling hardware. You can clear the screen VERY quickly using the
sound DMA by sampling 8channels at 50khz directly to the screen, so

you can effectively clear the screen using no cpu time (with only a few bus
cycles lost).

DSP

I didn't have the time (or documentation) to mess about with the DSP,
however by dissassembling the ROM I worked out that it should be possible to transfer from
DSP to CPU memory at about 3-5 megabytes per second, or 1 mb/s using
one of the operating system routines. The DSP will be able to rotate about one
million vertices per second!!! Which is approximately 10 times faster than
an 020 or 030 could manage. The Falcon will blow the A1200 away when it comes
to 3d games.
The DSP reference book is very difficult to get hold of, but I've got one on ordered - it
costs about 60 pounds.

Regards.

Hello,

I previously posted about a SuperCharger/HD problem I was having,
it is quite important to me but no one has responded. I'm sure there are
people with knowledge about the topic, but then I realized that my post
may have misguided people as to the return address. I believe using an
rn reply command will not work since the message is coming from a machine
inside Cabletron (where I work.) You must mail to cleaves@ctron.com in
order for the mail to reach me. So if you replied, and it was sent to
venus.ctron.com it would never reach me and would most likely bounce back
with an unknown host message.

If anyone has any experience with SuperCharger working when it cannot
be the last ASCI device please mail to me, I really would like to get it
working again, but my new(used) HD does not have two DMA ports.

>Sam.

Does your Unix network have Mtools? If yes, then your in luck.

mformat a: (format the floppy to an IBM format, ST will read)
mdir (get directory listing of IBM format floppy)
mcd (change directory on floppy)
mcopy _files_ a:/dir (copy files from current Unix directory to floppy
directrory, a: neccesary. Swap arguments to copy
from floppy to current Unix directory)
mdel (delete files on floppy, if you use wild cards then or
subdirectories, then enclose with quotes)

There are a couple other commands with mtools but these are the only ones
really needed to transfer files to and from a floppy disk. I have heard
rumors that that file transferd by old versions of mtools don't work with
Atari ST's. I can't verify this however. I hope this helps.

You would likely need the program doscopy,
which runs on most Intel-based unix boxes.
The disk itself has to be formatted on Tos1.4 or higher,
or even on a real DOS box. (don't do it on the
Intel-unix box, it would waste _much_ time).

Hard & Soft in Germany is the only company *I* have heard of which sells
such an adapter (it is necessary). They sell it together with a TOS 2.06
expansion card for older STs (not 'E') since you need TOS 2.06 to be able
to boot from the IDE disk. Furthermore, you will (obviously) need a power
supply for the drive and a disk driver which can handle IDE (eg AHDI).

|> Pekka.Janhunen@fmi.fi

Well, I don't believe it is possible, because there are *no*
single sides floppies on MS-DOS machines.

DOS 3.X to 5.? is supposed to look into the boot sector to
read the floppy data: No. of tracks/sectors/sides etc., but it
doesn't. The data are put there just for fun. We are lucky that
MS-DOS format programm writes the correct data, (It might even
be a bug :-)) but DOS recognices only the DISK-TYPE byte.
(And even this not according to MS specs).

I'll try it on a DR-DOS machine, but I dont't expect anything.

BTW, can't you change the LINUX source to read these disks?
There must be some driver to read DOS-floppies.

See comp.os.linux.announce for help on the LINUX part.

|> Thanks for any hints,

To summarize the responses I got for this:

Most workstations with 3.5" drives can happily read normal MS-DOS (and
hence ST) format disks. The most popular way to do this seems to be a
collection of utilities called Mtools, which re-create the basic disk
operations of DOS on UNIX.

Mtools is PD - in the UK ftp micros.hensa and look unde /tools
- also try comp.sources.misc on news

Other alternatives:
The command fdformat -ld will format a 720K floppy on a Sun.
Openwindows also supports a `dos' command which opens up an MS-DOS
utility apparently (I seem to have a man page and nothing else :-)

Thanks to everyone who replied.

Sam

: >around unfortunately), I've been wondering if I could use the drive on
: >my Unix machine.

: Does your Unix network have Mtools? If yes, then your in luck.

Mtools as distributed assumes 9-sector disks and will not read or write 10-sector disks (in standard use on many Atari systems). It's a simple matter to have Mtools read the boot sector and set the SPARC's floppy to 10-sector mode. The only problem is, the SunOS floppy driver assumes no one would ever change that, so it doesn't reset automatically when you're done using the device. This means that if you change to 10-sector mode and forget to change back, someone else could have problems trying to read disks with a program that assumes the driver is set in 9-sector mode.

Changing the floppy driver's initialization code to set 9-sector mode, in addition to all the other things it already does, is trival for the people at SUN (try ONE MORE LINE of code in the driver). However, SUN is so beurocratic that it's impossible to talk to the programmers. The managers see even a small bug as a lot of bug-report, bug-fix, version-number paperwork. Therefore, when we told them about the bug, instead of fixing it, they told us that was not a high priority.

I have a version of Mtools which automatically looks at the disk and sets the # of sectors correctly, setting it back to 9 sectors upon exit. I use this version routinely to transfer files, and never worry about how many sectors are on my floppies. The only way things could get messed up for other users is if mtools crashes in the middle (a vanishingly rare occurance). It's available as anonymous FTP from milne.geology.yale.edu, as /pub/mtools.tar.Z. I'll also mail it to anyone who asks.

If true this is excellent. Everything I had previously heard indicated 1Mb/s
was the upper limit of the hardware. A transfer rate of 3 or 5Mb/s makes the
DSP much more useful for general purpose processing because this would be fast
enough to start thinking of the DSP's local memory as a data cache rather than
it's total memory.

>PS. Buy a Falcon, I think Atari finally got something right!

Where do you suggest I get one?

Say, that's a really cute trick. No, you can deactivate the microphone input,
so it doesn't matter if anything is plugged in there or not. However, it *does*
rely on there not being an 8-channel audio input plugged into the DSP port...

> Line-A is a big NO-NO.

And that is a big lie, perpetrated by Atari. The simple truth is, if they do away with line-a, they kill too many important applications which currently rely on it. If they kill those applications, they cease to exist as a viable market force.

If Atari were to provide some new OS functions which supply the functionality that is currently available only by touching the Line-A data structures, then we'd have the best of both worlds: a klunky old interface deep in the OS could go away, and programs that rely on that functionality could be updated to use the new functions. Until they start providing such functionality, hitting the Line-A data structures is the only way to get some things done.

As of now (TOS 4.02 on a Falcon) the mouse position parts of the Line-A are still valid. Some Line-A functionality only works if the Falcon is in an ST-compatible video mode (things like complex blits). But, unfortunately, as of TT TOS, some of the Line-A blits don't work right even when you're in an ST video mode. My complaint to Atari got a response along the lines of "we don't suport Line-A, not even the parts we said we'd support. Use a VDI blit." Unfortunately, you can't do near as much with a VDI blit as you can with a Line-A blit. The VDI data structures don't give you enough control. I had to write my own asembler routine to do the type of blit in question.

But the day Atari completely removes the Line-A data structures without providing equivelent functionality via VDI or other-subsystem functions is the day I mothball my Atari machines for good.

Yes its called TOS 1.04, this is the ONLY way to go...

It was for sale in many U.K. magzines and should be cheaper now that
TOS 2.06 is $60us and TOS 1.04 was $99us..

Go get it you won't regret it....

922. groff testers wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-18 10:02:08 UTC
From: boender@dutiws.twi.tudelft.nl
Message-ID: <C2n2JL.FLs@dutiws.twi.tudelft.nl>
Source record: 40477

Hi all,

I am currently finishing a port of groff 1.06 to the Atari ST under MiNT.
However, I am unable to test all of it myself, since I'm not a troff
expert. So, before I release it, I'm looking for some people willing
to do some testing and send possible bug-reports to me.

Required configuration:
2 Mb RAM (preferably more)
1.5 Mb harddisk space for the executables (any file-system)
0.9 Mb harddisk space for the library stuff (minixfs: case-sensitive)
0.1 Mb harddisk space for the man pages (any file-system)
MiNT
The bourne shell /bin/sh
Preferably, the `perl' interpreter
Access to a PostScript printer/previewer or a DVI printer/previewer.
Experience in running shell/perl scripts.

If you mail me, I'll send you some zoo archives next week.
Thanks in advance,
Hildo Biersma
boender@dutiws.twi.tudelft.nl

> on a PCB, because I have need of such an application.

Circu It! is a object oriented circuit layout editor that makes the
drawing of them very easy. You can export these circuits in many
formats (SPICE included!).

Route It! is a PCB layout editor, that runs in parallel on any TOS or MultiTOS
and is getting the circuit data in real time from Circu It!. All you have
to do is start the autorouter, and your circuit is converted into a
functional PCB!

For more information about Circu It! an Route It! mail to me, or write

925. Fractal driven MIDI - HELP!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-18 12:06:05 UTC
From: spxaf@thor.cf.ac.uk
Message-ID: <29345.9302181206@thor.cf.ac.uk>
Source record: 40480

Hi,
I was advised to post this letter to comp.sys.atari.st.tech, so
if this question is irrelevant, then please direct me to the appropriate
newsgroup.

Basically, I am doing a project at university which involves
generating fractal information, and then sending it in the form of
pitch, velocity and duration data to a connected synth.

I am using Hisoft's Power BASIC, and basically don't have a
clue :-)

If you have ever written a similar program then please let me
know. I would be grateful for help on not only the fractal part, but
also the sending of information to the synth.

Please E-mail me: spxaf@uk.ac.cardiff.thor

Thanks, people.

Anton.

926. malloc() problem in the mintlibs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-18 12:56:47 UTC
From: boender@dutiws.twi.tudelft.nl
Message-ID: <C2nAMo.IxM@dutiws.twi.tudelft.nl>
Source record: 40481

Hi all,
I think I've discovered a serious problem in the mintlibs when using MiNT 0.99.
MiNT currently has a pagesize of 8 Kb; any small malloc() will result in
sbrk() requesting *just* 16 or so bytes more than 8 Kb. MiNT gives sbrk()
8 Kb and allocates 2 pages, of which one is almost unused.

There are various ways in which this could be fixed. For instance,
malloc() could ask just a little less than 8 Kb, so that sbrk() will ask
for a correct amount; or sbrk() could call getpagesize() and always allocate
in multiples of that. The main problem with this would be that this would
cause malloc() and sbrk() to become very dependent on each other (using magic
values or sharing variables and so on).

So, does anybody have a (preferably clean) solution for this?

Hope to hear from you,
Hildo Biersma // boender@dutiws.twi.tudelft.nl

...

Actually, I was just wondering about this recently. It seems that Eric is using Gnu C. Now as far as I remember the "CopyLeft" agreement, you weren't supposed to distribute binaries at all. Furthermore, you weren't supposed to sell your final product. You *must* give it away for free. Now this raises the interesting picture of Stallman suing Atari if Atari includes the MiNT kernel in the Falcon. Am I right about this? I haven't concerned myself with the GNU project in years now. I use Lattice C and Sozobon C. . . .

In a single tasking system, this may work quite well.

But considering MiNT and MultiTOS (or even the pseudo-multitasking provided
by ACCs), this doesn't sound like a good idea at all - what happens if more
than one process tries to grab /one/ vector?
What happens if process A grabs the bus error vector and process B causes a
bus error - how does your exception handler react?
What about virtual memory systems (like VRAM or OUTSIDE for the TT) - they
need the bus error vector to implement paging!

ACCs should not steal vectors; and, IMO, APPs shouldn't do so, either.
Only the operating system or resident programs (which effectively become
part of the operating system) should link into trap, interrupt or exception
vectors!

Source record: 40488

> [timer b interupt handler does...]
>Start of interrupt
>Clear interrupt flag
>Do code
>End interrupt
>Now surely this means that the interrupt could be interrupted by itself?

No, the interupt shouldn't be able to interupt itself, because even
though the interupt-in-service bit has been cleared in the MFP registers,
the CPU is still running at IPL 6, and that prevents another MFP interupt
(of any sort) from coming in until the IPL is lowered. Unless you lower
it manually in your code, that means that it can't be re-interupted until
your RTE pops the original SR from the stack.

If you want the ikbd to be able to interupt your routines, you should be
able to get that effect by lowering the machine IPL to 5 at the start of
your routine, then set the interupt mask bit for your interupt and clear
its in-service bit. By masking your interupt, you prevent a re-interupt
while in the service routine, but the MFP will still latch an interupt
that comes in and will hold it. By clearing the in-service bit, you allow
other MFP-based interupts to be asserted to the CPU, which is now at IPL
5, so the level-6 interupt the MFP asserts will get through. At the end
of your service routine, clear the mask bit for your interupt, and if a
new interupt had occured it will be asserted (unless a higher-priority
interupt is also pending on the MFP).

Mind you, this is all in theory, according to the docs. I've never
actually needed to do this in exactly this way, although I've used similar
techniques.

934. Re: How to write new verison of rsrc_load()... kosher?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-18 17:51:22 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Feb18.175122.7075@mnemosyne.cs.du.edu>
Source record: 40489

> I want to write a new version of rsrc_load() that will be compatible
> with new RSC formats.

A tall order. Especially given that Atari isn't very good at defining new formats of things that are compatible with the old. They aren't even very good at keeping old things the same when they've promised to do so.

Anyway, I don't think it's a very good idea to try to handle this with resident software. There's a lot of programs that use embedded resource data and don't even go through rsrc_load() or rsrc_obfix() calls anyway. (None of mine do.)

What the world needs is an easy-to-use system for embedding RSC data into a program, including custom fixup routines that handle the resolution scaling issues. Luckily, I have such a thing, and have been using it for years. It not only scales the objects' xywh values, it even scales IMAGE and ICON data to compensate between the creation resolution and the runtime resolution.

Unfortunately, I've never released this program, because someone has been hounding me to package it as a commercial product and sell it, and I just can't make up my mind whether I want to do that or not. I've been tempted many times to release it as shareware, but I figure I'd never get any money for it, ST folks don't pay shareware fees.

The main thing that has prevented me from releasing it as PD or shareware is that the docs are 2 years out of date. I just can't get up the energy to spend a week or more rewriting the docs from scratch to prepare it for release. Also, I have no idea whether it'll work with GCC; right now it works with HSC, LC, TurboC, LaserC, and MWC. But for widest acceptance, GCC support is a must.

So what's the point? I dunno. Convince me, maybe. Convince me that enough folks would contribute $10 for a professional-quality RSC file compiler that made embedding RSC data into your program and automatically scaling it to the runtime resolution as easy as coding a single #include statement with no other changes to your code.

Message-ID: <1993Feb18.190428.11790@cs.yale.edu>
Source record: 40490

```
: So what's the point? I dunno. Convince me, maybe. Convince me that
: enough folks would contribute $10 for a professional-quality RSC file
: compiler that made embedding RSC data into your program and automatically
: scaling it to the runtime resolution as easy as coding a single #include
: statement with no other changes to your code.

I can't convince you of that. I can tell my experiences commercially
marketing software. My first commercial product was Mi-Print. It was
an application potentially useful to a wide audience. I sold it
through Mich-Tron. They sent me _one_ check for $525. After that,
they _deducted_ money from my account every quarter because
distributers kept returning copies to them. That was in 1986, when
the ST market was a lot stronger than it is today.

My second commercial product was The Vault, a hard disk backup
program. I spent a lot of time writing it and wanted to sell it
commercially. The company I sold it to went out of business, ending
up delaying the program's release to the public for a year and costing
me a lot of money. I decided to distribute it on the Internet because
it's a lot less hassel, not to mention the legal responsibility
involved with a commercial program. (What if it crashes or doesn't
work?) It also gave me a wider distribution --- the whole world, as
opposed to the United States.

Furthermore, the ST market is small and shrinking. Even if everyone
who might use your program were to buy it, you still wouldn't make
much. Most of the remaining market is in Germany; to sell it there,
you'd have to find a company willing to do so, meaning you'd have to
deal with German companies (trans-atlantic business relationships are
difficult), or find an American company willing to export to Germany.
You'd also have to translate the manual, or get it translated;
foreigners are willing to deal with English docs for shareware, but
not for commercial software.

The ST market is so dead now that I only have a vague idea of
available commercial software. Chances are, if you sold your program,
I wouldn't even know it existed. Many other ST users are experiencing
this too, as their dealers stop carrying Ataris.

And last of all, consider how much would your program is worth to
average ST programmer. How much would _you_ pay for it, if you're a
competent programmer and already have many other (free) options open,
including Atari's built-in rsrc_load as well as something you could
hack quickly yourself.
```

So I'm not arguing that ST users will pay for the shareware. I'm just stating that commercially marketing the package, _especially_ one with such a limited audience as yours, is not likely to make you more than a few hundred dollars after a lot of trouble, and your program will likely never be known to most potential users of it.

--- Bob

BTW, if there's interest in Mi-Print, I could probably post it. The contract has probably expired.

The way I use the system is this.. I format disks with bad-sector
checking. From then on, I don't do a write verify. I suppose you could
format without bad-sector checking, and always use a write verify, but the
first method allows quicker usage of the floppy, and almost eliminates "Error
writting to disk" messages.

PageStream, Calamus, and AtariWorks all provide for .GEM metafile inclusion,
so a PS->GEM converter would vastly increase the applicability of that
software.

Verify is a nuisance! I have NEVER had any defect disks, apart from the
ones my disk-drive stuffed up (due to a misaligned head, which I fixed)

I also always have write-verify turned off al the time, makes floppies
almost usable! Again, no problems in 8-years!

You've misinterpreted copyleft on both counts (they're common mistakes, especially the second one). The GNU GPL basically requires that (a) you make source code available for GPL'd programs (you can do this in a number of ways, including making an offer to provide source), and (b) you not impose restrictions on the further redistribution of the code. This makes selling the code for profit rather difficult (after all, one customer can buy the program and *legally* give it to all the other customers), but not impossible. In fact, there's a company (Cygnus) that does just that, and makes its money on support. The FSF and Cygnus get along very well, I hear.

All of which is rather beside the point, since MiNT is not covered by the GNU General Public License. Merely using gcc to compile a program does not "infect" it with the copyleft. If it did, I would simply switch to a different compiler: MiNT compiles with Lattice C and PureC as well as GNU C.

(Linking with the FSF GNU libraries does bring a program under a form of copyleft, which is one reason that I didn't put any of the FSF's code into the MiNT libraries back when I was maintaining them.)

As always, I'm not making any statements on behalf of Atari. The opinions expressed are mine alone.

Regards,
Eric

Just a quick message, enquiring if anyone knows whether First-Byte computers still exists, and if so (or if not), where I could possible get in contact with someone either who works/worked there, or someone who might be able to help with the upgrading of some of their software!

944. CFV: Creation of comp.sys.atari.advocacy

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-19 11:16:07 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1993Feb19.111607@cs.bham.ac.uk>
Source record: 40399
Cross-posted to: news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

```
FIRST CALL FOR VOTES
====================

This is a Call for votes on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Rationale
=========
This group will separate a section of discussion, mainly from the current
newsgroup comp.sys.atari.st but also relatted topics including the Atari 8-bit
range of computers (atari.8bit) and the new Atari Falcon computers.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST can
continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

Voting
======
VOTING PERIOD IS:
16th February 1993
to 16th March at 9:00 GMT.

HOW TO VOTE:
1. REPLY to THIS message.

2. send your votes to:
JANET(UK accademics): dxo@uk.ac.bham.cs
INTERNET(all others): dxo@cs.bham.ac.uk%@uknet.ac.uk

WHAT YOUR MAIL MESSAGE SHOULD CONTAIN:

For a yes vote:
---------------------------------------------------------------
I vote "Yes" for the creation of "comp.sys.atari.advoacy"
VOTE: [lastname], [firstname] [email address] : YES
```

.

For a no vote:

I vote "No" for the creation of "comp.sys.atari.advoacy"
VOTE: [lastname], [firstname] [email address] : NO
.

Rules on voting
===============

Voting Rules:
-Only one vote per user (Two different people cannot vote under the
same user name).
-Any votes which are received before or after the voting period
will be discarded.
-Any vote which does follow the above examples specifically,
will not be valid.
-Anyone who wants to change their previous vote may do so by voting
again. They must indicate that they have previously voted and are
changing their mind in a footnote. A changed vote will discard your
previous vote.

Ambiguous Votes:
Ambiguous votes -- those who do not follow the specified format, or
do not make clear the voter's intent, will, where possible, be
returned to their senders for clarification. Ambiguous votes which
cannot be returned to their senders or for which no clarification is
provided will be identified in vote mass acknowledgements and in the
final vote tally.

******* ANY PROBLEMS, MAIL THE ADDRESSES ABOVE! *********

Thanks to Danny Richman for the basis of this CFV!!!!!

>
As far as I know, the Falcons DO have Line-a, BUT that works only in the
ST and TT video modes, so a program using those functions will most
probably NOT WORK in any other of the new video modes.

> As of now (TOS 4.02 on a Falcon) the mouse position parts of the Line-A
>are still valid. Some Line-A functionality only works if the Falcon is in
>an ST-compatible video mode (things like complex blits).

see above, line-a works only in the ST and TT video modes.

Have you thought of a VDI replacement, which is faster than the Line-a
functions? In the manual of NVDI, they say that line-a is NOT FASTER
than the normal VDI output.

This CFV did not appear in news.announce.newgroups and therefore should be considered invalid. If the proposers did send this to n.a.n, then they should not have posted a separate article outside of the moderated news group. Thus, when the votes are tallied, any vote whuch were submitted prior to the appearance of the official CFV must be discarded.

> missing OBDEFS.H and GEMDEFS.H, but have HSC/GEMFAST

The GEMFAST.H file contains everything that OBDEFS.H and GEMDEFS.H
contained under the old Alcyon compiler. So you can just nuke the #include
statements for those.

But, I was told that UUCODER was written for GemFast v1.5, so I'm
surprised that it would even have references to those older header files.
Maybe the source you have is way out of date?

I was planning on finding the UUCODER source myself and updating it a
bit, sometime in the upcoming weeks. Besides allowing an option for where
to put the output file(s), I wanted to add frm_progress() calls, and I was
going to embed the RSC data so that you don't need the .RSC file. But, if
someone else is already doing it, that's fine with me. :-)

>concerned myself with the GNU project in years now. I use Lattice C
>and Sozobon C. . . .

You are assuming that the final product (i.e. MultiTOS) will be compiled using GNU C. Source code that compiles across a wide range of compilers isn't subject to any restriction. And the "CopyLeft" applies only to FSF products. There is a GNU General Public License which covers software compiled using FSF libraries (like libg++ or the libc replacement), and code using output from Bison generally follows the GPL as well.

You don't HAVE to give binary code away for free. You do have to agree to provide source code to anyone who asks for it -- provided you use FSF products covered by the GPL.

You won't see the FSF suing Atari over MiNT or MultiTOS.

956. Neodesk 3.03a Neoqueue Bug

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-19 22:10:44 UTC
From: rmsara@ecst.csuchico.edu
Message-ID: <1m3lt4INNmgn@charnel.ecst.csuchico.edu>
Source record: 40411

Well, I thought that the last patch before Neodesk 4.0 comes out would be bug free, but either I'm doing something wrong (I don't think so), or there is something wrong with the new Neodesk.

Last week I downloaded it from Genie and installed it as the directions asked for. Everything worked, and I was very impressed. Until yesterday. I wanted to print out a document directly on my printer and decided to use the Neodesk accessory, Neoqueue, to print it out. Well, it doesn't work. I load up the file and close the accessory and it doesn't work. I reopen the accessory and accidently open a window and, for some reason, the document starts printing, only a couple of pages. I click on the window again and the same thing happens again.

Does anyone have this problem with Neoqueue or is it just me.
Also,
it only prints in draft mode!!!!

I need help on this. :-<

> (Please reply by email to linda@cs.su.oz.au)

Just buy one of the ADCSCI Plus boards from ICD, you will need a
board to translate the SCSI to MFM. I use an Adaptec 4070, they
are others which are much better than the Adaptec. I formatted my
MFM 251 on RLL and got a *(^ of a lot more disk space. Since the
ICD software does write verify without any slowdown, it works
great. There software is awsome. If you want the new v ersion or
driver for something just download it from their board.

I believe GEMFAST used to come with obdefs.h and gemdefs.h files which
just included gemfast.h. Steve probably used the old names for
backwards compatibility.

> As far as I know, the Falcons DO have Line-a, BUT that works only in the
> ST and TT video modes, so a program using those functions will most
> probably NOT WORK in any other of the new video modes.

Let me try to be as clear as I can (despite the fact that my prior message on the subject was couched in absolute terms, without anything such as "I think" or "it should"): The portions of the Line-A data structures having to do with mouse position are still valid on a Falcon, in all video modes. In fact, most of the Line-A data (all the parts that I've investigated) are still valid on a Falcon, in all video modes. I have two Falcon machines onsite, this is not speculation.

> Have you thought of a VDI replacement, which is faster than the Line-a
> functions? In the manual of NVDI, they say that line-a is NOT FASTER
> than the normal VDI output.

Apparently you didn't read my posting. Or, you just didn't get it. Performance is not the issue, functionality is. There are some things you can do via the Line-A data structures which you cannot do via VDI calls. There are some things you can do with Line-A blits that you cannot do with VDI blits, because the data structure used in the VDI blit calls does not provide all the fields you need to get the job done.

Again, I have no problem with Atari removing the Line-A interface from the machine, it was a klunky interface at best. My complaint is that Atari is not providing equivelent functionality through a better-controlled interface (such as VDI or the XBIOS). Until Atari starts providing Line-A equivelents, they should expect people to keep using what's available, that being Line-A. As long as applications continue to use Line-A, Atari will find it difficult to completely remove that interface from the system. If they completely remove it anyway, enough applications will break that people will be upset. Also, since some things will be impossible or incredibly difficult to implement, less software will be written as a result. In both cases, you have a downward spiral of marketability of the machines.

> RAM DIP locations or what. What about mounting of the new RAM?

Assuming you mean upgrading with simms:

run the wires off the dip positions.
Use either double sided foam tape or a hot melt glue gun to fix them in
position. Make sure that you can still get the shielding on. (do a trial
fitting...)

As for sockets, it's up to you, but simms are so cheap that it's
hardly worth taking them out of your machine if/when you upgrade
or change in a few years....

There's a couple of upgrade instruction texts sitting on a.a.

[> --
[> Andy MacCormack, aka armless, aka arjm@uk.ac.ed.dcs
[> "I am not ashamed of the Gospel of Jesus Christ for it is the
[> power of God to salvation of all who believe."

You use the usual routine to determine if you got a click, and then immediately
after the click you check the status of the shift key using Kbshift(), which
is Bios #11. You pass it -1, and it will give you (in the return value) the
status of the various shift keys. The values are:

0 Right Shift
1 Left Shift
2 Control
3 Alt
4 Caps Lock
5 Right Mouse Button
6 Left Mouse Button
7 Reserved

This is a bitmap. I am not good at decoding bitmaps, though, so I cannot
tell you how to decode the value if more than one shift key is pressed (for
example, Alt + Control). For just the one button, though, you can use the
value listed.

So, if Kbshift returns 0 or 1, the shift key is being pressed.

Is this what you were looking for?

> Line-A is a big NO-NO.

i> And that is a big lie, perpetrated by Atari. The simple truth is, if
i>they do away with line-a, they kill too many important applications which
i>currently rely on it. If they kill those applications, they cease to
i>exist as a viable market force.

That is no lie. Atari keeps saying "Don't use LineA" for years and years now, just to prepare for the day the kick it out.

The original statement is:

"The Line-A graphics interface is maintained for backward compatibility with existing ST programs only. It should not be used for new programs. It will not keep pace with future hardware or software improvements. The VDI should be used."

See what I'm saying? They have the old programs in mind, but don't implement Line-A for new hardware.

Actually, TT low res mode and all the Falcon modes beyond 16 colors can NOT be fully accessed via Line-A! It already happened, although Line-A is still there and useable in ST compatible modes.

Apart from that, there is absolutely NOTHING that an _application_ can't do by using proper VDI and AES methods.

>at all.

>Jim Omura, (416) 652-3880
>'jimomura@lsuc'

I am afraid that you remember it totally wrong and this can be
easily checked by reading corresponding copyright documents.
What you describe would be the case if Eric would use a *** code ***
from FSF. But neither MiNT code, nor libraries used with it,
come from GNU project and terms of GNU license do NOT apply to them.

As an aside; note that various pieces of the current GNU project fall under
GNU Library License which is substantially less restrictive.
It is good idea to read carefuly all legal documents attached to
a particular piece of code/software you are going to use.
Note also that a number of definitely commercial companies (with
NeXT most prominent among them) is using, and distributing, (derivative
of) gcc compiler with a full blessing from Stallman and friends.
Quite a few pieces of a commercial software (and some pretty
expensive too) on todays market were compiled with gcc compiler.

You can try to get them from Quay (pronounced `Key') Computers in New Westminster (BC). You can call them at +1 (604) 522-2915, or their BBS at 522-7105. They sell their TEC boards for $180 plus GST. I bought mine in October '92 (just before I moved back from Vancouver to Edmonton). Good luck in getting your TEC (you won't be sorry for the investment!).

Source record: 40427

Hello there,

Since I've got a HD with no DMA pass-thru, I putting my SuperCharger up for sale. It wants to be the last device in the chain. It works perfectly, runs anything I ever needed. Turbo C++ and Turbo Pascal have been its main uses, and compiling is a pretty good test I think. Best run with a monochrome monitor emulating Hercules Graphics. Comes with Messy Dos 4.01 and mouse driver. Best used with a hard disk, but can be used with floppy only systems. Even lets you use its 1 meg of RAM when you are on the ST as a RAM disk! Very impressive device, got me through college so I didn't have to give up my ST and buy a PC. Taking offers, or inquiries now.

If MiNT and/or MultiTOS can't handle multiple applications hooking system vectors, it is simply another indication of how lame they are, and yet another strong argument against using them. To ask applications to cripple themselves just for the convenience of supporting a half-implemented multitasking kernal is not reasonable.

(Mind you, I don't know for sure that MiNT/MultiTOS don't handle this properly. I would expect that they do.)

If you're willing to spend some bucks, look into "Power Print" from GDT
Softworks. It's a Canadian company. They have a special package for Spectre
GCR owners. If you decide to contact them, let them know that you're using
Spectre on the Atari ST.

Their IDE-compatible driver is for Falcon and ST Book users (whose machines have IDE drives). They don't have IDE host adapters for the ST, so unless you can find an IDE->SCSI adapter, you won't be able to connect the drives to the ST.

Source record: 40431

I'm having great trouble getting Spectre 128 to print with a 24 pin Epson Printer (LQ400).

It worked fine with Aladin, though the printout was 25% smaller than it should have been, and that was with the Australian Imagewriter Driver. I have tried Chucks Printer drivers with limited success.

If anyone is using Spectre and successfully running out of the parallel port, please let me know your secret. It may just be that I have to find a printer driver....

Thanks....

> If MiNT and/or MultiTOS can't handle multiple applications hooking system
>vectors, it is simply another indication of how lame they are, and yet
>another strong argument against using them.

Come on, Ian. You know as well as I do that if two programs grab the same system vector and try to use it in inconsistent ways (e.g. two applications grab the mouse input vector directly) then there can be problems. At best, one of the programs won't work as expected; at worst, the system can crash (depending on what the vector was and what the programs were trying to do with it). That's always been the case under TOS (we've always had limited multitasking, in the form of desk accessories). It's just more noticeable under MultiTOS because in that environment one tends to run more applications simultaneously.

That's not to say that programs shouldn't use system vectors; just that they should use them wisely, with the full understanding that other programs may want to use the same vectors too.

Thats the Windsor (Service Centre /Mail Order) line of Systems Solutions.
Quoted price for NVDI version 2.11 is UKL 39.95 - They indicate list is 49.95.

BTW, I quote from an advert. I have no connexion with the company what so ever.
I haven't even used them as a supplier so it would be nice to hear how you get
on.

Someone posted a request for more info on NVDI and who distributes an English version.

Can I suggest that they contact Karl Brandt. He can be found at:

Systems Solutions
The Desktop Centre
Blackwater St
East Dulwich
London SE22 8RS.

Tel: (Int) +44 81 693 3355
(Dom) 081 693 3355

Karl has been of great help to me in the past. He knows the Atari computers very well and has kept my computer going when I thought it had died.

With regards to NVDI. Well I have had TurboST and QuickST on my system and NVDI has been the only one which has not caused me any problems. I would recommend it to anyone who is wants to speed up application screen responses.

>

Remember to plant a pointer to the 'start' of the resource file in the AES global array. Dunno what 'start' exactly means in this case, I never have been able to figure out what the AES does with this value - it certainly doesn't use it for error checking :-)

I think the only thing you can do to make it slightly safe is to check the version number word at the start of the file. If it doesn't match any version(s) you know about, pass the call to the original rsrc_load().

I've modified a uudecode variant to run under GEM nicely, with progress indicators etc etc. The variant? Oh, it was the most compatible one I could find around a year ago, couldn't tell you the original author offhand. I'll put the sources on a.a if time permits later this week.

There is a nice programm called v24blast. It has his own TRAP-Dispatcher.

You can get about 3500cps with ZModem. (on an 8Mhz ST)

Hi

I bought a SCSI drive and I'm planning on buying a DOS emulator.
I've got some old information on the Supercharger and it looks
very interesting to me.
Now I'm wondering :
- exist a Supercharger with 80286 processor ?

The supercharger has to be connected to the DMA port.
- Does it provide a SCSI hostadapter so that I don't need an
extra one for my HD?

Every information is welcome. Maybe somebody knows a Internet or
other-net address of beta system ?

Thanks for your responce
Thomas

>> [I say MiNT/MultiTOS should handle multiple apps hooking system vectors]
> [Eric Smith says that's unreasonable]

As far as I'm concerned, it is the responsibility of the multitasking
kernal to keep applications isolated from each other. That's exactly why
the 680x0 chips have a vector base register. Remember, the subject we're
talking about here is not hardware device drivers and their interupts,
we're talking about the vectors an application might want to hook: unused
TRAPs, and common exception vectors such as 2,3,4,5,8.

Every mainframe OS I've worked with (in 22 years of mainframe
programming) handles this. OS/2 handles it. Windows 3 handles it.

Part of the process of a context switch in multitasking is to handle the
virtualization of system resources. If MiNT/MultiTOS don't handle this,
then I have to assume that 1) you just can't figure out how, or 2) the ST
and other TOS machines just don't have the horsepower to handle it. (I
rather tend to suspect the latter, myself.)

That pointer in the global array is used for a variety of things. It
points to the first word of the resource header structure of the file
that's loaded into memory. The rsrc_free() uses that to make an Mfree()
call to free the resource. (So if you haven't loaded the RSC into memory
aquired via Malloc(), then you need to take over rsrc_free() as well, and
free the memory in whatever way is appropriate.) It is also used by
rsrc_gaddr() to locate objects in the resource data.

> bare SCSI drive cable to Falcon-style SCSI-2 port

I've got a cable (from Atari but you can get them elsewhere) that converts the SCSI-2 DB50 connector to a standard C-50 external SCSI connector. What I can't find is something to convert the C-50 to a dual-inline-50 such as a bare SCSI drive uses.

I've been told that CompUSA stocks the parts to make your own, basically by using a ribbon cable and a C-50 clamp-on for it. I haven't had time check this out, though, since the CompuUSA here is 35 miles away on the other side of town.

I don't know what a "lamer" is!

But the falocn has more speed, higher resolution and better sound than the
current STs. The TT may be better if you would just like more speed, and
the highest resolution MONOCHROME.

Why would you prefer a Falcon over an ST? 4x speed,
Many more colors
Slightly higher resolution
(the colors will make it look
photo-like, not the resolution)
DSP can give great speed if programs
use it.

Myself, I want a TT just because of the 8x speed
19" mono support

I don't see why malloc() and and sbrk() should become dependent on each other
if sbrk() is fixed to Malloc() in multiples of MiNT's page size.

>talking about here is not hardware device drivers and their interupts,

Well, I included hardware device drivers and their interrupts as "system vectors". Perhaps we are using different definitions of what a "system vector" is, and that explains part of the confusion.

>we're talking about the vectors an application might want to hook: unused
>TRAPs, and common exception vectors such as 2,3,4,5,8.

OK, let's examine the exception vectors. Debuggers will want to hook exception vectors so that they can catch exceptions occuring in other applications. If we make exceptions per-process, then the debuggers will break. Similar comments apply to all sorts of utility programs that are quite common in the ST world (print spoolers, file selector replacements, and most TSRs). Perhaps TOS should never have allowed programs such access to the lower levels of the machine; but it did, and unfortunately we're stuck with it :-(.

Finally, the 68000 does *not* have a vector base register; only the 68010 and above do. While I, personally, would be quite happy to throw out 68000 support, there seem to be a lot of ST owners who want to be able to run MiNT and/or MultiTOS on their existing machines.

> Every mainframe OS I've worked with (in 22 years of mainframe
>programming) handles this. OS/2 handles it. Windows 3 handles it.

Most mainframe OS's don't allow you access to the hardware. IBM's VM operating system is a notable exception; but the overhead of emulating the machine's hardware in software (i.e. providing a virtual machine) can be quite high. (I wish we could assume a reasonable minimum configuration, like an 8 megabyte TT; but for various reasons that just isn't possible. Incidentally, we will be shipping a version of MultiTOS that boots on a 1 megabyte floppy system. You can't do anything practical with it, but it does boot :-)).

>Am I right about this?

No, not in any way. Code developed or compiled with GCC is the sole property
of the author, unless it uses the GNU C Library, which MiNT doesn't.

And "CopyLeft" makes absolutely NO RESTRICTION on the sale of ANYTHING.

Read the GNU Manifesto for details. GNU GPL and GNU LGPL are available
everywhere.

Well. Then please tell us *how* a multitasking system can correctly
handle system vectors and variables (without sacrifiying performance).

In my opinion, real-world applications can be written without access
to this low level stuff, and I simply don't want to see more and more
(slow and memory consuming) hacks in the kernel just to make some old
applications happy.

How do you embed a resource file in a binary? I know it is possible, but
how is it done? The various resource construction sets I have allow you to
save the resource file as C-Source code, which would be the obvious first
step. That only gives you the resource structure, though. How do you put
it in memory (like the system resource load call does)?

Is this a specific feature of certain compilers, or can it be done with
Sozobon? I'm going to be releasing a new program soon, and I'd like to do
away with the resource file if possible.

From memory GUCK is no longer PD, and I think is sold
in the U.K.. by the ST-Club..

Can some one confirm this and the price and version..

And do the take bankcards...??

Roger.............. sheppard_r@kosmos.wcc.govt.nz

Well, perhaps it is time to upgrade my Cubase - but this doesn't change the fact
that v3 doesn't work. In spite of what the guy at the show said, I DON'T have a
pre-release version of TOS. I'm not a developer, I'm just some guy who own's one
of the few production falcons sold so far.....and Cubase v3 broke on it real bad.

Hello!

I have the image processing program AIM (Another Image Manipulator, TU Delft)
version 2.51, for the Atari ST. This version is dated 1988.
Does anyone know of a newer version?

> exception vectors, per-process, then debuggers won't work

It shouldn't be too tough to define a program flag bit that can be used for things like SYSMON and debuggers (and even device drivers) that tells the OS that this program is installed in the system-level chain of handlers and is not to be handled on a per-process basis.

> the 68000 does not have a vector base register

Of course not. But then, the 68000 also doesn't have the power to reasonably run more than one application at a time. Hell, it barely has the power to run one at a time. (Unless you define multitasking as "letting one thing run well because everything else is waiting for something anyway." That works well sometimes, but let any two applications try to use a lot of CPU at the same time and you'll feel like you're running on a Timex-Sinclair, not an ST.)

> IBM's VM operating system...the overhead of emulating the machine's
> hardware in software can be quite high.

Actually, of the big-3 OSes for IBM mainframes, VM is by far the leanest-and-meanest of the bunch. Of course, by itself it doesn't do much, you need a guest OS or two running under it to get any work done.

Still, Windows 3.x takes the VM route to a large degree, and it performs pretty well on hardware not even as powerful in many ways as a 16mhz 68030.

1014. DIY memory Upgrade Problems, HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-23 18:48:47 UTC
From: psurge@cs.utexas.edu
Message-ID: <lokscfINN3h7@earth.cs.utexas.edu>
Source record: 40369

I am utilizing the Do-it-yourself Memory upgrade from atari.archive. I decided to do the entire 4 megs at once, so I removed all my DRAM chips from the motherboard. The motherboard is REV. B.

So I built the board to hold the memory chips (1x9 80ns SIPP, 3 chip style) and soldered
the wires to the board in two sets, each corresponding to the two banks of memory. I then soldered the wires to the motherboard in the manner indicated, connecting the D pin from each Dram to the corresponding SIPP, then connecting the rest of the wires to one of the DRAM slots in each respective bank. Pin 18 is connected to pin 64 of the MMU.

All I get is a bunch of garbage on the screen (in the desktop colors) and the system locks up. I followed the directions exactly, and I am sure there are no shorts. If anyone has any insights to this upgrade, please let me know, I need to get this computer back up and running, so I can at least find out how much money I have in the bank...

Now my questions... Is the Q pin (pin 14) of the DRAM slot supposed to be empty? The SIPP diagram in the handout shows the D & Q lines combined, and makes no indication that anything should be connected to the Q pin.

I have 4 pins on the SIPP board that are not connected to anything. Namely pins 26 from each SIPP. The others that are not connected are speciffically listed as such.

Pins 22, 28 and 29 of the SIPPs are connected together. Pin 22 is a ground connection. Should it be connected as well as the Ground connection on pin 9?

On the same lines, Pin 1 and Pin 30 are both listed as Vcc. Which one is to be connected? Right now both are connected to the same spot in the DRAM location. Might that be a problem?

In the process of removing all the DRAMs, I damaged two of the capacitors that were next to each DRAM chip. I have since repalced them with 225pf capacitors, which look very different, but are the same rating (ie, the old ones were 225pf also). Could this be a problem, or are the capacitors needed now that the DRAM is gone.

Finally, is there any way to verify if the chips are bad (memory, MMU, etc)? I have been rough with my 68000 in the past and it still worked, so I don't see that this would really be the problem.

Please, I really need input, either posted to the newsgroup or through email. I must get this upgrade done soon, or purchase a new computer, whichever turns out to be the case... Time is of the essance.

Thanks,
Troy Carpenter

Gee, don't tell the LapLink folks that. If you do, they may feel
obbligated to recall hundreds of thousands of hardware/software packages
they've sold for PC<->PC linkups through a parallel port. Of course, the
recall might confuse the users of the product, who haven't found any
problems with it. :-)

Not strictly true - not as the ONLY way. If you use DCFORMAT v3.0 (or possibly earlier versions) it will format a floppy and then write an MSDosBoot sector of the correct type to the disc. Very handy at times!

Does the system do anything? Are you seeing a lot of vertical stripes
of various colours. I the answer is 1) No 2) Yes you may need to replace the
68901. This has happened on two STs of mine, both after performing various
internal modifications.

The problem, on at least one of my systems is/was the 68901 no longer
could accept its clock from the crystal! I jury rigged a TTL oscillator
onto the 68901 and the system has been running for three years now.

The other ST that exhibited this behaviour I foolishly sent to Atari,
who promptly returned my system 4 months later. This is why I bought
the second ST.

I found this out by putting an ICE, In-Circuit Emulator into my ST and
watching where it died. Then I tapped the 68901 TTL clock with a grounded
wire and the silly thing booted up!

ESD works in strange and darned annoying ways.

I hope it's something simple!

Brian

1019. MiNT Distribution Kit docs

>I am looking for an inexpensive HD a starters HD. I am looking for a used
>maybe 20m or more CHEAP!!!

You might want to try rolling your own. It is very easy for the ST. You
need:

A host adaptor
A power supply
An enclosure
A SCSI drive

I recommend the ICD Host adaptor. It has (IMHO) the best software, which is
updated frequently (and available free). They also provide a very easy way
to add a battery backed up clock to your ST (if you don't have one already,
they can be bought with or without the clock). I also like ICD's because they
report any "sense codes" the drive communicates to the user. I have only
seen one ("read error with recover", induced by dropping something heavy on
the desk while the hard disk was reading), but I find it reassuring that
any weirdness at the device level is reported directly to me (it pops up in
the corner of the screen, by the way). Price is about $80 at last look.
Without the clock, you save $10. Order the SCSI connector cable whereever
you get the host adaptor, and make sure to ask for a dual drive one with a
red wire denoting pin one (to make the installation easier).

Power supplys are cheap. Just pick up an old XT power supply for ~$30 from computer shopper. If you can find a junked PC, you can get one for free.

Enclosures can also be cheap. You can buy one of those huge old style XT cases for about $30 from computer shopper. This will hold all the hard drives you will ever want! Buy a tower stand for $5 and stick it on the floor (the ICD cable is nice and long for this). You can also go all out and buy an enclosure which will fit under your monitor (mine houses 2 5.25" devices, has a front mounted lit power switch, mates perfectly with the ICD board, etc) with power supply for about $125. There are several places that sell these for the ST, two being Toad Computers and D&P Computer Supply. Email if you want their 1-800 numbers. Again, a junked PC is the absolute cheapest way to do this. If you can get ahold of grannys old IBM XT, you are in fat city. A nice side bonus is that the old PC motherboards make great wall hangings (big fat traces, lots of chuncky looking components). Old PC's are really easy to find, now that everyone is going to 80x86 machines.

Now, the SCSI drive. These can be bought from computer shopper. All you need is a bare SCSI device, no other boards or anything. The ICD host will work with just about anything, but there is a very large list of already tested drives that comes with the host adaptor (which I could probably email to you also). Drives are very cheap nowadays, and if you want to really save money you can get a refurb. Several of the refurb places will guarentee their drives for X number of years (X varies with the particular company), so they can really be the way to go.

Anyway, you will now have your hard disk. You bolt down the drive and host adaptor (you can drill some extra holes in the case, or use wire-ties or whatever), connect the two, plug in the power cords (the ICD comes with a little splitter which connects to a standard PC type power cord), hook up the DMA, and boot up. It is very simple, and is not easily botched up. You only need to pay attention to:

SCSI id jumpers set to some reasonable value
SCSI terminator pack plugged into the drive
SCSI connector from drive to DMA is right side up on both ends
Nothing wiggling around

The first two can be checked via the manual that will accompany the drive (make sure you ask for one, some places assume you already have one), usually a 1 page Xerox. The third can be verified by checking that the red wire side of the ribbon cable is near pin one (which is marked on the board either by a number or by a square solder hole instead of a round one). If the cable is in backwards, the red end will be at the other end of the connection (quite often it is pin 2 that is marked, but you only need to know which end of the connector the numbers start on, and match it with the red wire). These are the only two possibilities. You cannot mess up the power connections or the DMA connection (they won't go in wrong).

The reason you wanted a dual drive cable is so you can easily add another device in the future. You merely have to plug it into the other receptacle on the cable, remove the terminating resistor pack off the middle drive on

the cable (the one on the plug closer to the computer), and check to see that the SCSI id jumpers are set to two different numbers. Oh, by the way, the ICD supports the Syquest SQ555 (the 44mb removeable cartridge drive) without any special concerns. Since the Syquest is a SCSI device, you can hook one of these up just a easily as you could a regular fixed disk drive. These only cost about $320 bucks nowadays, with 44mb cartridges going for ~$60.

It really is easy, and there are plenty of computer tinkerers around to look over your shoulder and verify what you do. You can also use a setup consisting of a host adaptor, SCSI controller board, and ordinary PC type hard disks, but you add complexity to the system and lose performance this way. Straight SCSI is much cleaner, and usually much faster (SCSI devices have their controller boards "built in", comunicating with the SCSI standard).

If you do get a hard disk, you should immediately buy Neodesk 3 and the Universal Item Selector III. They will make life much nicer. Also, beware of buying too small a hard disk. Megabytes are like potato chips. I have a buddy with a 105mb quantum drive, a 320mb Hitachi, and a Syquest SQ555 with 6 cartridges all hooked to his ST, and he still complains about not having enough disk space! I have not yet gone that apeshit, but I think Mr. Visa might have to talk to Syquest Corp. pretty soon. Oh, notice the my friend above has three SCSI devices hooked to his ICD. This just requires a 3 plug cable. The ICD can support 8 SCSI devices, and you can hook up multiple host adaptors if you really need to (like if you get given a box of 10mb SCSI drives :-).

Please feel free to email questions. The above is IMHO, direct flames elsewhere.

Wrong. You may ship binaries as much as you please, but you *must* provide the sources TO THE FSF PARTS of your binaries [or at least provide a pointer to the sources]. Also, you must provide a means for your customer to modify the FSF parts of your product [this is the real problem, as it might mean the requirement to provide object as well as binary files, especially when using Gnu libraries].

> Furthermore, you weren't supposed to sell your final
>product. You *must* give it away for free.

Wrong again. Please read the Gnu General Public License ["GPL"] or read the discussion in gnu.misc.discuss. You may charge as much as you like for the final product. You may not charge for the FSF sources that you must provide, beyond reasonable media cost.

I accidentally told DC Format to format a disk that I wanted to write an MS-DOS bootable sector to. Fortunately, I was able to pop the disk out after the second track, so I'm pretty sure that all the information is intact. Unfortunately, I can't get DC Format or even the ST Desktop to recognize the disk.

Can someone out there recommend some help for getting everything after the second sector of the disk?

Please post or mail any help you can offer.

Thanks in advance.

Personally, I wish fewer people would embed their RSCs into the program. Separate resource files allow for a limited degree of cosmetic fixups and customizing, embedded RSCs don't. Unless, of course, you have a utility that can locate embedded RSC data in a PRG file, extract it, allow it to be manipulated, then re-embed it in the program?

This sounds nice, but how well have you found bitmap scaling to work in practice? It seems to me that bitmaps scaled up will look "clunky" and scaled down may look ugly due to holes, discontinuities and distortions? Wouldn't it be more effective to have bitmap pairs (for the two divergent resolution classes) and automatically link in the appropriate one at load (or pseudo-load) time?

Of course, even bitmap scaling glitches would be preferable to the usual alternative. I.e., decently sized icons with huge gaps between them in one resolution, and grotesquely elongated icons in the other. (Now where have we ever seen anything like that? :-)

1026. Re: #### CAN I CONNECT A SCSI HARD DRIVE TO MY ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-24 05:38:49 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1mf1l9INN3k3@golem.wcc.govt.nz>
Source record: 40381
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

These days, if you want to run a SCSI drive on the ST, you just need:/

SCSI Drive (Plus a box to stick it in, or it looks 'orrible)
SCSI Connector Cable
ICD-Link

The ICD-Link, just converts the ST's ASCI, into a SCSI, the general upshot of which is, you plug one end of the Link into the ST, and the other end into the connector cable, which is plugged into the Hard-Drive!

(You will also need the Power-Supply unit, otherwise it sort of won't go! 8-)

Also - (To the original poster as well), Yes Atari does (did) make Hard-Drives, they were slow, grotty and huge (size, not storage space), they also cost a fortune! Making your own, or buying a 3rd-party drive is a LOT cheaper!
(It is quite possible to put together a 60meg SCSI drive unit for the ST for around $300) - Using all brand-new parts!

[> going to embed the RSC data so that you don't need the .RSC file. But, if
[> someone else is already doing it, that's fine with me. :-)

Hey, no problem, if you want to add more features - go for it, sounds
like you'd do a better job than I would!
(A little progress bar would be nice - or a '???% completed' readout,
it'd make things just that much nicer 8-)

Imbedding the ReSourCe file would be great too, and as I don't have
the slightest idea how to go about doing that (or, even if you can
using HS-C). If you want the Source code, I can stick it throubh
c.b.a.st it, or E-Mail it (Or, I suppose I could stick it up on a.a)

The source code is well documented, it even shows exactly where to stick
the redirection code etc, and everything is modular (a seperate file
for the Fsel routine, one for decoding, one for encoding etc. etc.
makes things much easier - Steve Y. did a good job!)

1028. Falcon specs for palette change/identity needed!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-24 06:32:12 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1mf4pclNN5tl@shelley.u.washington.edu>
Source record: 40383

I am finishing a very fast GIF Viewer called Speed of Light, but it has palette problems on the Falcon. It works great on an ST/STE/TT, but is just white on the falcon. I have two problems that need solving, I would appreciate any help...code prefered in C, GFA Basic or Assembly.

1. How do you change one of the colors out of 256 on the Falcon. I know on the TT it is xbios(83,...), and on the ST's it is xbios(7,...), but what is it on the Falcon, and how do you specify RGB values? Neither of the xbios numbers just mentioned seems to work on the Falcon.

2. How do I know if the program is running on the Falcon? Is there some memory location that tells me this, or some routine I can run to check this? This will help me to know what palette setting command to use.

Thanks for any help you can give me...I want everyone to be able to use my programs on all Ataris.

Let's see. Two tracks, that's 18 sectors or more. That's more than enough
to erase the bootsector, the file allocation tables and the root directory.
I'm afraid it is almost impossible to recover that.

1030. MiNT libs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-24 09:45:48 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <C2y5sD.6xL@dcs.ed.ac.uk>
Source record: 40385

Hi everyone.First all I would like to thank everyone who has
helped me with my problems compiling and using MiNT 0.99 - especially
those people who I haven't already thanked by mail.

My main problem now is to do with MiNT lib28 which I have just
got from atari.archive.I can't make any of the .olb files that gcc wants.
I know that they are available pre-compiled,indeed I have them,but I would
really like to be able to make them myself as I want the '020 versions.

When I try to make the libs,using GCC 2.3.3 (shareable version from
the updated MiNT distribution kit) I can compile everything apart from the
.cpp files,and I get loads of .o files but I still don't get any .olb files.
If I try making gmakefil.16or gmakefil.32 I get an error - "mincl:142
commands without asociated target " or something like that.What am I doing
wrong,and what should I be doing?

Hope you can help,
Cheers,Joe.

1032. Emacs in TT RAM

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-24 11:28:59 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <C2yAKC.Arr@dcs.ed.ac.uk>
Source record: 40387

Hi,I have jsut compiled emacs 18.57 on my TT using GCC 2.3.3 and
MiNT lib25,and while it does run,I can't get it to run in TT RAM.The program
works fine as long as the load-to-TT-RAM bit is not set,but if it is,it just
bus errors as soon as I try to run it - does anyone know why?The code should
be able to handle 32 bit addresses as it was compiled with GCC's m68020 option.

Hope you can help,
Cheers,Joe.

1033. HARD DISKS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-24 11:46:21 UTC
From: pcxkrm@unicorn.nott.ac.uk
Message-ID: <1993Feb24.114621.8473@cs.nott.ac.uk>
Source record: 40388

This may be a FAQ, but I haven't seen it answered, although I vaguely remember a thread on it in the past:

Can I go out, buy a dead cheap PC clone SCSI hard disk, then buy an ICD adaptor (e.g. "the Link" is one I've seen) and plug the whole thing into my STE (TOS 1.62)? - I'm talking about the UK here, not the US, where HD's seem to be about 2-a-penny.

If so, why do dealers charge so much for Atari-specific drives?

Are there any reasons why I shouldn't do this, even if it's possible?

Any advice on this matter would be much appreciated, as I'm working with a pretty limited budget here, and can't afford to make the wrong choice!

Replies by email if you don't think this is of global interest.

Thanks,
Keith.

You can find that out by inspecting the _MCH cookie, but you don't have to if you use the VDI interface,

Hi, the reason emacs won't work in TT-ram, is because it is only 24-bit clean
by default. You must redefine a constant in one of the header files.
Can't remember which right now, but a grep 24 *.h should do the trick.
When you find the name of that constant, redefine it to 26 and recompile.
If you can't find it, send me mail and I'll look it up.

Alternatively, you could wait a few days until emacs-18.59 is available
on a.a (It has been uploaded, but have not put in the mint-directory yet).
This one definitively works in TT-ram.

etc. etc.

I think we're being a bit vague about what this 'line-a works' and 'line-a doesn't work' means. Line-a is a *SET* of variables *AND* routines, for very miscellaneous purposes. Some of the variables are important for applications like Calamus, but not all! Anyway, the routines don't seem to matter. I think the mouse position is a very universal one, that is likely to be kept; in Direct Color modes some of the variables (like number of planes) will make no sense.

'Line-a is a big NO-NO' should be 'line-a, chapter ** is a x% NO-NO'.

On of the things that are impossible is this: Set a non-white background
for a v_gtext. The only thing you can do is first draw the background then
gtext in transparent mode. But this will cause display flicker which is not
what you want for text windows.

You're right about PC's of course, but Atari does have a handy little program
for sending files to/from the ST Books that use the printer port so it's no
big deal. Remember: nothing is impossible, it might just take a little longer..

Cheers,

I think I can answer your questions and possibly help you out. I own a SuperCharger, it has a V30 microprocessor, this supports a 286 instruction set, but is NOT a 286, it still runs at XT speed. SuperCharger does need to be connected to a DMA, not only that, it must be the last device in the chain. I recently purchased a used HD that only has 1 DMA port, and SuperCharger will not work in any other position. I tend to think the problem is that the HD is an extreme hack, and the SCSI driver is accepting info that should only be going to SuperCharger. As a result, I am selling my SuperCharger, I no longer need it, I only ever used it at school to run Turbo Pascal 6.0 and Turbo C++ 2.0 (which is quite impressive for an emulator.) It works great, especially with a monochrome monitor. It will do color (CGA, but I prefer hercules with monochrome.) At any rate, I'm selling, you sound as though you would like one, so...

Respond if you have any interest and give me an offer, then we can talk further.

That depends on the kind of files you want to recover - it is possible to
recover short files (less than one cluster) and text files and with a little
luck even GFA-Basic files.

I once had to recover the contents of a disk (since I hadn't made a backup).
The procedure was roughly as follows: First you get a sector editor, then
you scan the clusters and try to figure out which clusters belong to which
file (a starting point is provided in subdirectories). At last you rebuild
the FAT and the root directory.

I think it cost me a week or so to recover most of the text files (it's a
BIG puzzle, after all).

HELLO GUYS !

It's the first time that i write an article .

I would like to have some news about the marvellous machine ; the FALCON 030 !!!

- First , has someone seen a F030 yet ? I have been waiting for it since last december and i'm
going to become crazy if i won't have one before nextchristmas!!!!

- I'd like to know how much does it cost , because in France , they seem to want to sell it for at least 5,000 Francs (1,000$) for the one Meg configuration without Hard-disk... HURGH!!!!

- and at last, could someone tell me if it's possible to connect an external IDE HD ??? (SCSI are too
expensive for my (very) little budget...)

Waiting for your responses.... A lonesome atarist in France.
(for the moment : futur member of KAMIKAZES'group when I have a machine...).

It may not be possible using GEMDOS functions, but I think it can be done quite readily using the appropriate parallel port registers. I can think of two programs that read from the parallel port - one is the blitz disk duplicator and the other is the task switcher Switch/Back. I don't think either of these programs use the parallel port for bidirectional data transfer, but it does demonstrate that data can be received through it.

: It may not be possible using GEMDOS functions, but I think it can be
: done quite readily using the appropriate parallel port registers. I

The parallelport-register is the register no. 15 of the YAHAMA-Sound-Chip. To control this chip, you must use the command XBIOS 28. To initiate a CENTRONICS-controlled GAL-programmer I used this trick in the last time. The advandage is, I could go round the handshake. So, I only used the XBIOS 28 - command to send an output-signal to GAL-prommer. Therefore I don't know at the moment, the correct XBIOS 28 - command to get a handshakefree inputsignal. I think it will be very interessting for many ST-peoples to know how to receive a CENTRONICS-input with XBIOS-28.

Another thing is. Everybody who develops a circuit to connect with the CENTRONICS-Port should be very carefull! Because of the YAHAMA-Sound-chips. It is not cheap and not easy available.

Another way to get a parallel input is the ROM-Port with 16 Bit,
by the way if you work with a ST....

Greeting Thomas

> and customizing, embedded RSCs don't. Unless, of course, you have a
> utility that can locate embedded RSC data in a PRG file, extract it,
> allow it to be manipulated, then re-embed it in the program?

This is a good example of why I embed RSC data. Often I have groups of objects (especially string or text objects) which are treated as a contiguous array by my program. If a user edits the RSC file and scrambles the order of the objects, Bad Things will happen at runtime. I also rely pretty heavily on extended object type values, and if those get messed up the program will break.

> [ICON & BITBLK scaling]

If you're a perfectionist, you'd probably want to have separate low and high rez icons/images in your RSC data. My program doesn't prevent that, because it supplies scaling as an option.

I've found that doing an icon in low/medium rez and letting it be scaled to high rez by duplicating each line works fine 90% of the time. If you consider your icons to be more "works of art" than visual cues for your users, you'll probably disagree.

The program offers 4 different algorithms for scaling down a high rez icon to a lower rez. (AND each line pair, OR them, take only even lines, or only odd lines. No dithering or anything else fancy.) With a little experimenting to see how each works, and bearing in mind how they work as you design an icon, you can do fairly complex high rez icons that still look acceptible when scaled to a lower rez.

> [How do you embed a resource file in a program?]

I have a program that does 99% of the work for me. It reads the RSC file and emits C source code. But not C source like the RSH file stuff that you've seen before (it can do RSH, but I never use that feature). What it outputs more closely resembles the actual structure of the RSC data, and requires less fixup. It also does a few extra things like (optionally) consolidating multiple occurrances of identical strings to a single occurrance.

You embed the data using a single #include statement. In addition to bringing in the C-source-form RSC data, a couple macros hoist the rsrc_load() and rsrc_free() functions, so that they automatically get rerouted through local routines instead of calling the AES functions. And finally, the local fixup routines are also #included automatically. The local fixup routines are the real magic of the system. They do xywh fixup appropriate to the runtime resolution, do image scaling if you've requested it, and patch the embedded RSC data into the global[] array elements that the AES uses to locate RSC data.

There is code available which does the runtime fixups on RSH-style resource data. I don't know the filename, but I've seen the code, years ago.

I completely trashed my directory & FAT sectors on a disk, most of which was a 350K text file, so I got out 'Salvage'. Scanned through the disk for the start of the text, told salvage that was the start sector, and the last one was about 400K after that. Saved the resulting copy to RAM-Disk, loaded into a text editor, edited the garbage out of the end of the file, and bingo! 100% okay text file!

(There was also a couple of other files I managed to recover the same way, just took a little longer!)

WIthin half an hour, I had 95% of the disk resurrected! (Except for the Fat, Boot & Directory sectors of course... Good old RAM-Disk!)

A few comms packages support the parallel port for modems!

It is quite possible to send & receive, as I have been doing so, converting
files over to my old Atari 800XL (8-bit)

Simple cable, and no fancy tricks! (The software did it for me!)

Good idea, but how do I access this from Assembly Language or GFA Basic 3.5E?
Also, doesn't this define colors used by VDI commands? These have
different indexes from the color values that you write directly to screen
memory (e.g. Color 1 in VDI is color 15 if you write it to the screen!)
So how would you know how to covert between these. Is there some formula
that uses XORs or something?

>> 2. How do I know if the program is running on the Falcon? Is there some

I don't think you got to finish your sentence there, but since I don't
have a Falcon, you'll have to be a little more specific. Also, I'm not
sure what a cookie is, is it just a memory location that you read, and if
so, what is this location?

Thanks for your help,

I bought my current hard drive configuration second hand, all ready to go.
I have a BMS host adaptor and an Adaptec 4000 SCSI->MFM adaptor. I want to
add a 2nd drive. The current drive is an old Wren I. The Adaptec is
capable of supporting the 2nd drive. I will require a disk with a 20 pin
command port and a 34 pin data port. Is it possible to find such old
dinosaur drives yet? Would CompUSA type stores carry them, or is everything
SCSI now? Also, is 20 pin ribbon cable available readily?

Not tale@rodan.UU.NET.... Invalid CFV

Organization: ASTRAsoft, Stoke-On-Trent England.
Lines: 98
Nntp-Posting-Host: jw9

No 'Approved: tale@uunet.uu.net... Invalid CFV

This isn't a good start. CFV's are posted by Dave Lawrence and posted to
certain specific groups. IF you have already submitted this message to
him and have decided to 'jump the gun' and post it yourself you have
invalidated ANY votes you may receive before the valid posting from the
moderator hits the net. In effect, you will have tainted the vote even
before it really began.

I'm against this proposed group, no secret. BUT I'd rather see it
defeated in a valid vote, not because someone screwed up the CFV
process.

Go to your room. You do NOT get a free cooky. :(

>Unfortunately, I can't get DC Format or even the ST Desktop to recognize the
>disk.

First, make a direct disk-to-disk copy of the floppy (the desktop
probably won't work for this, you'll need a disk copy utility like
Procopy)...work on the backup, so if you screw up you can start
over...

Can you write an MS-DOS boot sector onto it like you intended? If
not, you'll have to use a sector editor and copy sector 0 from the
good disk to the one you munged (make sure they are the same format).
You could of course build the boot sector by hand, but that's a
hassle.

Now that you've got a good boot sector, your best bet is to get
Diamond Edge, tell it to fix the disk using the second copy of the
FAT, and then PRAY there's enough of the second copy left to get some
of your files back intact . If you did format the fisrt two tracks, I
think you might be out of luck. If the second track is there, you
should be able to get some of it (though I think the second FAT does
begin on the first track...)

In any case Diamond Edge (or any other utility that can find lost
clusters) may be able to find some of your data and dump it into
"recovery" files, but you'll have to dig through these files to find
the stuff you want (possible if it's a text file, not readily
possible if it's a program or other binary data)

I don't work for ORA and I have no affiliation with them, I mention
Diamond Edge only because I happen to own it and think it may help in
your case. You may also be able to use ICD Cleanup, or Disk Doctor
(ancient), or some Beckemeyer program (can't rememeber the name).

Good luck!

Source record: 40314

I have recently d/led a copy of Hermes 1.04b. I have
installed it. I have changed the passwdfile, config.sys, paths,
spaths, etc. However, it doesn't work.

Usually it just locks up.(gus, login, and a number of other programs).
If I am lucky, when it locks up, it will tell me that I am
out of system memory and that I should run the folderxxx program.
However, I have a 4meg STe and do not see why this should be necessary
In fact, I think folderxxx causes trouble for my STe.

I am new to uucp and I may not have set this up properly. But
I have no clue as to why it would lock up. In addition, all of
the manuals(or most of them anyway) are in German. Are there
English docs available? Could someone give me a hand in setting
this up via email? or let me know what they think could be wrong?

Thanks,

Charles O. Onstott, III

In article <1mg4sb$jmu@news.cs.tu-berlin.de> kd@cs.tu-berlin.de (Klaus Didrich) writes:
:That depends on the kind of files you want to recover

Well, for my case, I lost a disk full of non-text stuff. (Old, but still, I wanted to move it to a different computer system.)

:The procedure was roughly as follows: First you get a sector editor, then
:you scan the clusters and try to figure out which clusters belong to which
:file (a starting point is provided in subdirectories). At last you rebuild
:the FAT and the root directory.

The problem for me is that since the first two tracks are gone, when I tell the Desktop to open the disk to see the directory, it just sits there. If I try to tell DC Format to put an MS-DOS boot sector on the disk, it bombs out on me.

I wouldn't mind if I could put all the (non-formatted) data of the disk into one file and then break up the file at points where I recognized the data as being different.

(See, the disk had some pictures on it, and I wanted to move them to a Unix system and use the PPM utilities to convert to GIF to make it more portable and easier for me to view. Since each picture has its own header information, I can discern that and then lop the file off at that point.)

Is there some sort of program out that will either help me recover the unformatted files or at least save the disk image as one huge file? (Preferably, it would be available by FTP for maximum convenience =)

Hello,

I had to take my SCSI drives off my ST as they where needed for a
new system, so I put my OLD SH204 drive back on my ST. The SH204 is a 20 meg
MFM drive by Tandon, I am using the Adaptec 4000 MFM--SCSI controller that
came with the SH204 along with the ATARI SCSI--ASCI board that also came with
the original drive. Now the question, I have a spare Seagate 225 MFM drive
sitting on my kithen table, what would be needed (and what do I have to do)
to add this drive to my system? Can the Adaptec card handle 2 MFM drives?
I heard from ICD that the Tandon drives in the SH204's had a hardware bug
that caused them to respond on all luns when queried? would this complicate
the issue severly? Sorry if this is simple but I do not really no much about
MFM technology.

please reply to:

I'm afraid you got something wrong there... LaTeX is NOT an editor, it's a
typesetting system. To install LaTeX on the ST, you need about 10-15 MByte of
free harddisk space, PLUS an extra editor. An implementation of LaTeX for the
ST is CS-TeX and can be found at archive.atari.umich.edi.

Hope this helps, Jules

I'd like to point out that if you leave the resource file as it is you
can easily change the appearance and the language of the program
without having to recompile the binary!

Several German programs feature two rsc-files, one in German and one
in English. The user can pick the one he wishes to use. I think that
is _very big plus_

And if John Doe wanted to read ancient Latin (or maybe something more
practical like his first language) in his menus and dialogs, he could
just tweak the rsc-file with an editor.

Hi there,

I have two little program written in C that I need to
compile, but since I have no C environment on my ST
(and I'm totally unexperienced with C!!)
I'm asking if some kind soul could do it for me....

follow the included sources (samlabel.c and samprint.c)

Thanks a looooot!!!
Savino

**********BEGIN SAMLABEL.C**********

```
/************************************************************************/
/* NAME */
/* samlabel - print a Roland 12-bit-sample-disk label and catalog */
/* SYNOPSIS */
/* samlabel roland-12-bit-sample-disk-file */
/* DESCRIPTION */
/* samlabel prints the disk label and contents for a Roland */
/* 12-bit sample-disk. */
/* The disk label layout is a bit strange. */
/* AUTHOR */
/* Copyright 1992 by Gary J. Murakami <gjm@research.att.com> */
/* V1.0 (4 May 1992) Freely distibutable for non-comercial use. */
/* All other rights reserved. */

1068. Re: To embed resources or not?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-25 16:02:24 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Feb25.160224.5680@newshost.lanl.gov>
Source record: 40323

I agree that there are times when NON-imbedded resources are preferable.
A very good example is when multiple languages are to be supported.
However, you shouldn't forget the reasons programmers started imbedding
their resources in the first place:

1) For the novice user, it's a lot simpler to have a single *.PRG file
to double-click and run his program from any directory and without the
worry of keeping multiple *.RSC files with the program file or in a
specific directory. To you and me it's no big deal, but to a novice,
it's just one more thing he/she can screw up. Then we get calls like,
"I just bought your XYZ program and the &%#@ thing won't work!" <groan>

2) Some programmers, myself included, do not really WANT users mucking
around in my resource files. As mentioned earlier, if the sort order of
resource tree objects gets out of whack, the program may die. And besides
that, I'd rather users did NOT change my copyright notice or other info in
the resource file which I felt was important when it was coded.

My $0.02.

1069. How to create an IMG file?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-25 16:11:52 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Feb25.161152.7486@newshost.lanl.gov>
Source record: 40324

Does anyone out there have the patience to describe to me in email how to create an IMG graphics format file? I've got a simple rectangular graphic and text image on my mono screen and I want to save it as an IMG file for later input into a desktop publisher.

I thought there was a utility or routine to convert DEGAS images to IMG format If so, wouldn't you lose a lot of clarity since DEGAS is just a bitmap image?

Thanks,

A better way of approaching this would be to ask people willing to compile a C program to mail you, and then reply with the sources to the first person who replied.
The problem with posting the sources is that it wastes network bandwidth (other articles may be lost on the way to some places as your article fills up disk space), and you will either get 50 binaries in your mail box the next day (Which will probably cause problems with your system, and possibly those en route), or none because everybody decided that it wasn't worth the effort to do something that somebody else had probably already done (Which is why I will not be compiling the sources for you (unless of course you mail me to say nobody else has bothered)).

Message-ID: <C30n40.H5G@news.cis.umn.edu>
Source record: 40329

I have gained access to a DEC RZ55 SCSI disk drive (350+ megabytes). I tried using the ICD ADSCI+ adapter board I have, along with the 6.0.7 software, to format the drive for my Mega ST. The ICDCHECK program sees the controller board as a DEC RZ55, but when I try to use the ICDFMT program to format the drive, it cannot 'find' it. Any suggestions on what I should try next? (I believe that the hard drive itself doesn't start spinning up until requested by the controller board ... perhaps that's where the problem lies?)

TC>the system locks up. I followed the directions exactly, and I am sure
TC>there are no shorts. If anyone has any insights to this upgrade, please
TC>let me know, I need to get this computer back up and running, so I can
TC>at least find out how much money I have in the bank...

You could get the Atari diagnostic cardridge and start the system with a
color monitor - that should give some hints.

If everything else seems to be OK and you still get garbage, it might be
that you have swapped the /CASL and /CASH lines on on or both memory banks.

TC>Now my questions... Is the Q pin (pin 14) of the DRAM slot supposed to be
TC>empty? The SIPP diagram in the handout shows the D & Q lines combined,
TC>and makes no indication that anything should be connected to the Q pin.

Pin 14 of a standard SIMM/SIPP is A6!

Here's the pinout for both 1M*[8/9] and 4M*[8/9]:
1MB*9 4MB*9

1 Vcc Vcc
2 CAS* CAS*
3 DQ0 DQ0
4 A0 A0
5 A1 A1
6 DQ1 DQ1
7 A2 A2
8 A3 A3
9 Vss Vss
10 DQ2 DQ2
11 A4 A4
12 A5 A5
13 DQ3 DQ3
14 A6 A6
15 A7 A7
16 DQ4 DQ4
17 A8 A8
18 A9 A9
19 NC A10
20 DQ5 DQ5

21 W* W*
22 Vss Vss
23 DQ6 DQ6
24 NC NC
25 DQ7 DQ7
26 PQ PQ ***
27 RAS* RAS*
28 PCAS* PCAS* ***
29 PD PD ***
30 Vcc Vcc

*** = only present on 9-chip modules, NC on 8-chip. Not used for ST.

TC>Pins 22, 28 and 29 of the SIPPs are connected together. Pin 22 is a ground
TC>connection. Should it be connected as well as the Ground connection on pin 9?

Of course - connect both GND and both +5V pins, and use *thich* cable (at
least 2.5mm^2)!

Pin 29 = GND is a bad idea, expecially if Pin 28 is grounded as well.
Connect Pin 28 to Vcc, so that the Parity bit is disabled and leave Pin
29 open. However, you might only damage the Parity RAM on the SIPP, this
should not cause the SIPP to malfunction.

TC>On the same lines, Pin 1 and Pin 30 are both listed as Vcc. Which one is
TC>to be connected? Right now both are connected to the same spot in the DRAM
TC>location. Might that be a problem?

As above, use thick cables and connect to thick traces on the
motherboard. Somewhere near the plug from the power supply would be a
good idea !

TC>In the process of removing all the DRAMs, I damaged two of the capacitors
TC>that were next to each DRAM chip. I have since repalced them with 225pf
TC>capacitors, which look very different, but are the same rating (ie, the old
TC>ones were 225pf also). Could this be a problem, or are the capacitors

No - they were 220nF, which is about 1000* more :-)
They are labeled as 22*10^5 (in pF). If the old RAMs are removed, two
missing Cs should not cause any trouble. But you might want to add some
ceramic (!) capacitors of about 220-470nF next to the SIPP power pins.

How easy is a Mega 1 STE to upgrade. By that I mean are the SIMM slots already on the computer and 1 megs SIMMS will plug right in? Which TOS version did most Megas come with? Might it have a HD drive? (ie, TOS 2.06)

Reason is, I can get a Mega 1 STe for about the same price as a 4meg 1040STe. I already have in my posession 4 1meg SIPPS (which should work as SIMMS with a connector conversion). Anybody have suggestions?

Also, are the 1040STe's equiped with SIMM sockets? Can I do the same as above with a stock 1 meg 1040STe (that is, put in the memory I already have?)

Thanks in advance,
Troy

If a user fools around with the resource file and causes the program
to crash, that is their tough luck (although as a developer I suppose
you could get a lot of disk returns under warranty with a screwed up
resource - most annoying!). As user, I have found very little need to
modify a resource.

You don't have to worry about changing a copyright notice in the
resource. Nothing prevents you from modifying the address in an
OBJECT tree or TEDINFO once the resource is loaded. Simply embed the
copyright notice in the program and put its address into the
appropriate structure. It seems to me that this would be a better
approach in terms of upgrades unless of course modifications to the
resource was part of the upgrade.

Message-ID: <1993Feb26.003756.17296@cs.yale.edu>
Source record: 40334

That's also a good idea because you you can change the (c) notice in the dialog box with just a change in your program. I have a file "version.c" in my programs which contains just a version number, which I then insert into the resource. When I change the program, I change version.c and add a comment to the end of it saying what the change does. I found that a lot easier than changing the resource every time I modified the program. Note that if you don't want people messing with the (c) notice, encrypt it, or else it can be changed very easily by any binary file editor.

One problem with the resource concept as a language-independent method, as implemented by Atari is twofold:

1) The language-specific parts (i.e. strings) are mixed up with the non-specific parts (i.e. resource object orders, etc). As has been pointed out, letting anyone modify the resource has potentially bad consequences if the structure is accidentaly modified.

2) Many language-specific parts of a program are not included in the resource. Examples include strings printed _inside_ a window, or window titles.

Both problems could be fixed by making a set of "language resource" routines which load a set of language-specific strings. Some would be used directly by your program, and other would be used by resource-fixup routines which would insert them into the RSC file in the correct places. Then, you could embed RSC files in your code, a great convenience, and still have language independence.

1081. Putting a DS/DD drive in SF354 case???

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-26 00:52:02 UTC
From: lenn@mentor.cc.purdue.edu
Message-ID: <C316Er.6Ls@mentor.cc.purdue.edu>
Source record: 40335

I have a friend who has an almost dead 1040 with a good DS/DD drive mechanism.

He then bought a 520ST and two SF354's with the intention of putting the
DS/DD mechanism in one of the SF354 cases.

First he put the SF354 single sided drive in the 1040 and it worked great.
Then, he tried to put the DS/DD mech in the empty SF354 case and he says that
the power and I/O cable plug in different places (opposite of SF354 mech).
The drive just spins and won't read anything. Does anyone know what is wrong??
I haven't seen it in person, so I don't know first hand what the situation lookslike.

Both the old SF354 mech and the DS/DD mech have the wide eject button, if that
helps.

Any help would be appreciated.

Thanks,
Jody Lenn

One little problem, one big solution?

Please help! I need some decent packers/compactors/crunchers for my 1040.
Arc/Zip/Zoo stuff is useless, I need compacted EXECUTABLES. I have a few
decent packers, namely

Automation v5.0.1
JamPacker v4.0
Ice v2.40

But they don't pack well enough. I am interested in later versions of these,
and also:
Speedpacker v2.0 or above
Pompey Pirates v1.7 or above
Atomic v3.0 or above
Pack-Fire any vers,

and anything else that is great. I know this may be asking a bit much, but
think of it this way ... if you help me, then someday when you need help, you
can get it too. If this stuff is on an FTP site, please let me know, any info
at all would be appreciated greatly. If you are feeling extra specially nice,
some stuff sent to my email address would be appreciated greatly. BTW all
Email (non-abusive) is welcome!

thanks,
Karl.

P.S. Has anyone seen a Falcon 030 down in OZ yet? PRODUCTION models?

There *will* be a Multi-TOS for ALL Atari's!

The one version will work on all machines. However, the RAM requirements are basically, 4-meg minimum, and a hard-drive is a MUST!

Running Multi-TOS on an STE would be pretty awful (especially on a color monitor - 640*200*4, 8Mhz - yecch!). But, it will work!

It is complete, and has been released with some of the 4-meg+HD Falcons (or so is claimed). All the files fit on a 1.44meg disk, so it's at least a lot smaller than WIndows, and if you buy that unit (or the one above), then it's free!

It is neither the full truth, nor a lie. Sorry. Some older PCs cannot read
the data lines of the parrallel port. However, data may still be transfered
using the input status lines. Several packages use this technique.

Regards,
-Roger

(installing trap handlers)

MK> In a single tasking system, this may work quite well.

It does. Rather well infact.

MK> But considering MiNT and MultiTOS (or even the pseudo-multitasking
MK> provided by ACCs), this doesn't sound like a good idea at all - what
MK> happens if more than one process tries to grab /one/ vector?

Then you end up with several of them in a chain - what's wrong with that? They each get a turn at handling it, one after the other.

MK> What happens if process A grabs the bus error vector and process B causes
MK> a bus error - how does your exception handler react?

It looks at the PC in the exception frame, and if it's not its fault, it lets it fall through...

MK> What about virtual memory systems (like VRAM or OUTSIDE for the TT) -
MK> they _need_ the bus error vector to implement paging!

That's a page fault, and not hard to test for.

MK> ACCs should not steal vectors; and, IMO, APPs shouldn't do so, either.
MK> Only the operating system or resident programs (which effectively
MK> become part of the operating system) should link into trap, interrupt or
MK> exception vectors!

Why on earth shouldn't an accessory intercept a vector? Providing it uses XBRA to do it, the whole process is completely transparent.

MK> Martin

Somehow I think you are a little confused here!

MF> I get confused. Our local support people (Atari Benelux) have assured
MF> us time and again there won't be a MultiTOS for the older machines.
MF> So why bother?

You haven't been listening. They have said that no decision had been made
on the availability of MultiTos on 68000 based systems. Now the decision
has been made and it will be available for those systems, but Atari will
not support it for these systems. It will only be supported for 030 based
machines.

Or better still, make the program create a checksum of itself every time it is run and refuse to run if it isn't what it should be. This will also prevent link viruses and other tampering.

>modify a resource.

I believe that the notion of detached ressource files is very handy at
an implementation stage. I am however not quite certain, how important
the ressource file concept is when releasing a program.

The only reasons for using rsc files would be to allow the user to
change something. If don't expect (or even wants) the user to change
menus and such, it would be common sense to embed the ressource.

Apart from hidinng it from the user, it is also more convenient to
have just a single prg file, for instance if you want to execute the
file from another directory, though I do not know if GEM still has
problems finding the ressource files, as it used to. But ressource
files is not improving the locality problems that many GEM (and other)
programs have. Too many programs does not really work well if you are
not positioned in the directory where the program resides, which is a
real pain.

Perhaps you would post your setup. I am not in immediate need as I do
have a harddisk, but TeX is a most overwhelming complex of programs
and heaps of small files, and some advice on what a minimum
configuration could look like, would not be so bad.

I guess the secret is to experiment out would you actually need (what
styles, fonts and such) and stuff the rest somewhere else.

I also use LaTeX - on a 1 floppy 2Mb STE! - I simply put lplain.fmt on
a 600K RAM disk, along with a small shell and MicroEmacs editor, then
have tex.ttp and all the style files/tfm files on the floppy. When I
wish to preview, I have another floppy with dvist_nd.ttp and a fairly
good set of fonts. The files I'm editing go on the RAM disk as well -
of course, this limits you to about 200K or so for an input file, but
I still have about 200K free on the floppy as well, so it would be
possible to \input files from there. However, you might have problems
running TeX in less than 1 Meg of memory.

Keith.

(Of course, it's much *easier* from a hard disk... :-)

To have a usable version of latex you need at least 2 MB of ram.

You can use twin floppy drives or between 4 and 10MB of hard drive space.

I have no idea where the 10-15MB came from!

Sounds to me that there is an error in your assign.sys file. It is looking
for a GEM.SYS file when it should be looking for META.SYS. Load the assign.sys
into an editor and change any occurence of gem.sys with meta.sys. Also, make
sure that your GDOS disk _has_ all the meta files, also.

Bob Broadie, Director of Communications for Atari USA (I believe that's
his title) has mentioned that it *will* work on standard 68000's, though
there is no hardware memory protection, so it probably would be more
robust on a 68030 system. I guess there was enough people out there
that wanted this that Atari must have listened (I know I'd like to
try it on my MegaSTe).

And Eric Smith, whom you replied to, is the author of MiNT and thus
the basis (and updatings) of MultiTOS - if anyone, he should know
what it should and should not work on :-)

Well, whatever is being told to people anywhere, we should see
Real Soon Now :-)

That may be true, but the NEW and CURRENT version of CS-TeX no longer supports
installations on floppy disks.

By the way, a better place to get CS-TeX (from France, that is) is
archive.cs.ruu.nl.

Never heard about such a bug, and there probably is no such bug, because
quite a few people have done what you intend to do. You will special
disk driver software, though, that supports the second drive. AHDI
won't do that.

I can't speak for any subsidiaries (actually, I can't speak for *any*
parts of Atari!). But I do know that the MultiTOS that we're going to
be shipping will work on a 68000. I'm told that it's actually quite
usable on a Mega STe; it's probably too slow to be practical on an 8Mhz
machine, at least if you're running more than 1 application.

Eric Smith ersmith@atari.uucp ersmith@netcom.com
As always, the opinions expressed above are mine, mine, mine, and Atari has
to have their own.

Packers:/ Better compression that Ice-Packet 2.40 is not likely!
(None of the versions you listed are any better!)

Use, either PFX-Pack (Quick & Good), or Ice 2.4 (Slow but better)

I usually use PFX-Pack on files larger than 150k, and Ice 2.40 on the
ones smaller!

About the only packer around that gets better compression for the speed
than Ice v2.40, is Automation Packer v5.0 (Lump-Chunk). Which isn't
available around here to my knowledge (no, I don't have a copy).

I used System 7 for the first time, within 15 minutes, I had it going properly, running Clarisworks & Hypercard.

It is SLOW however! Stick to system 6.0.8 and Multi-Finder!

The system file was about 1.7meg large. the finder file about 600k. And the machine was using 2meg of hard-drive as extended RAM (probably a major reason for the slow speed, although even when it wasn't accessing it, it was still quite sluggish!)

Multi-TOS isn't a bad idea, but reports reckon it also, is quite slow. But, it's free to most folks, so you can't really complain too much 8-)

Any-way, the Falcon still isn't officially in full release yet, so maybe everyone should stop sayin 'give me this & that' for the Falcon, before they can even get one..... (But, what the hey...)

From: B7NS@MUSICB.MCGILL.CA
Message-ID: <26FEB93.19297782.0068@VM1.MCGILL.CA>
Source record: 40268

Hi everyone,

It seems that for some reason MiNT 0.99 simply hates Overscan :-(
I can never get them both to boot together without crashing the
machine (it actually boots, but anything I run after dies with a
big bang). Also, I've noticed that v0.99 hates being run from
the desktop: some strange things happen if I don't run it from the
AUTO folder.

Finaly, I can't get bmake 3.6.3 to work properly: it does not add
file extensions (eg: it just looks for gcc, instead of
gcc.ttp, etc.); secondly, on many makefiles it exits with a
'*** missing separator' error. Is this caused by the makefile
having DOS style line delimiters? Thanks for any help,

Pete.

Message-ID: <1mmkm6INN77f@golem.wcc.govt.nz>
Source record: 40269

This would seem roughly the right time to create a comp.sys.atari.falcon newsgroup. As a lot of it is starting to become Falcon specific!

Maybe wait until about 2-weeks into March, by which time, the Falcon should be officially released. (They are available, but not 'official' yet.)

This machine is such a major upgrade to the old units, that conversation about it, in the same groups, would be almost futile, and a waste of bandwidth to non-owners!

Maybe, in the process, we will be able to shake off some of the unbelievers and paranoids!?!

--> '93 - year of the Falcon!

While I can't say anything about overscan, I can say that I've never
had MiNT in my auto folder (well, I did for about 3 days but I didn't
like it there) and 0.99 works fine for me.

>Finaly, I can't get bmake 3.6.3 to work properly: it does not add

I mentioned that file extension problem to Hildo Biersma (who did that
port) and haven't got a response yet. Meanwhile I'm probably going to
pull that file from the archive, as it's kind of obnoxious to have
someone download that hole file just to discover they'd have to make
their system entirely incompatible with TOS just to use that one
program. Maybe one of these days I'll actually find the time to do my
own port of make and compile it base-relative...

cheers,
entropy

Well, I wanted to boot my favourite shell through MiNT from the
desktop, but if I do this, then exit the shell (and MiNT) all kinds of
of wonderful things start to happen. It looks like some kind of
memory problem to me. Every time I run anything random portions of
the screen get filled with garbage (when the program does some screen
output it overwrites it and later it's OK). Eventually the system
hangs in a random fashion.

grins ... I've spent quite a lot of time trying to find an accurate definition of IDE. The best I've managed was a copy of a 'preliminary spec' released by a working committee - it covers the basics well enough though. You should be able to find it using Archie though.

Essentially you will need a small microcontroller to do the translation work, and yes, if you can make it for a realistic sum of money, you would certainly find an eager market.

i> (I rather tend to suspect the latter, myself.)

I'd doubt the latter very much 8)

The problem with such an operation is more one of finding an acceptable semantic than implementation - if someone writes a mouse accelerator - you want it to _always_ catch the mouse packets, regardless of which process is current. When it installs itself, you'd have to either notice, and try to guess whether you should install this vector for all the other trap-maps (neat term that 8) you have scattered around...

Or, you make it impossible to do things that way, and force people to use a new system call to install global traphandlers. (my personal preference anyway)
That's fine, but a big compatability hit.

Right now, I can't see a clean way of doing things either way, but leaving the vectors where and as they are is a big plus for compatability, which, to take your earlier argument up again, is a Good and Necessary Thing.

(I agree with your sentiment though. This needs to be addressed.)

Speaking of WinDoze and OS0.5 - that behaviour of theirs makes it very hard for me to implement the package I am working on at the moment - I am using a multitasking kernal called Ctask, and I want to communicate between a resident copy and one in the primary application for assorted reasons. Real bummer that. 8(

1128. Floppy disk connector for ST-Book machines?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-02-27 17:44:18 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Feb27.174418.24908@mnemosyne.cs.du.edu>
Source record: 40283

Does anybody know whether a floppy disk adapter is available for ST-Book machines? I checked with Atari (USA) and found out that a couple prototypes may have been built, but were never turned into a product. So, I figure if such a thing exists, it's probably in that hotbed of 3rd-party hardware development: Germany.

The ST-Book doesn't have a floppy controller chip in it, so an external controller would be needed. (I think the ST-Book brings the ACSI lines out, so it should be possible to hang a controller off of them, the question is whether it's been done.)

> create a comp.sys.atari.falcon newsgroup

Well here's my vote AGAINST that idea. The Falcon is an ST with a few more graphics modes and better sound capability. It is so similar to the ST/TT machines that I can't see any point in fragmenting discussions about it (which aren't exactly overwhelming the capabilities of the net or anything anyway!).

Or perhaps we need comp.sys.atari.1040 and comp.sys.atari.STe, and comp.sys.atari.MegaSTe, and .... ???

I want to run TCSH on the Falcon under MultiTOS, but it keeps getting memory protection errors because the version I have was compiled with the old MiNT libraries that had the bug int them. So I got the source from a.a, and it's about 50 .c files with a makefile. I followed the directions and copied the correct st .h file from the config directory, and typed make. It gives a huge string of errors. Apparently I need to modify the makefile, but I have no clue how.... Could someone who's successfully done this give me some pointers? Alternatively, does anyone have a compiled version of TCSH for MiNT .99? (BTW, I'm using MiNT .95 to compile it because that's the only way I can run TCSH. And I do have the new MiNT libraries installed...).

Also, mfsconf.ttp doesn't seem to do much... when I type mfsconf, it gives me the usage; something like this:

usage: mfsconfig path [-ldsx] [m|t|b|n]

So I type mfsconfig u:/ -ldsx m and it keeps giving me the usage message. What am I doing wrong? Will running this correctly automatically fix the problem with man and make? BTW, my setup is directly off the MiNT distribution kit (by Simon Gornall)... with all the subsequent updates installed, including the mfs fileutils.

Thanks for any insightful information!

>disk driver software, though, that supports the second drive. AHDI
>won't do that.

"I never heard of it so it can't be so." What an enlightened attitude.

In fact there is such a bug in some early SH204 units. I have one. As
far as I've heard, it only affects SH204s which have a Tandon mechanism
inside, but it could affect others, I'm not sure. My original SH204 would
respond to any LUN number (0 - 7) on its controller, and that prevented
ever adding a second mechanism, even though the Adaptec 4000 can handle
two. I eventually just punted the Adaptec and the Tandon, and added an
ST1096 SCSI drive in their place.

CHECK ZIP ERRORS WITH STZIP22..

I found a small problem with this program, I e-mailed
a file from tu-berlin 1stgui_1.zip and found that the check zip gave crc errors
on 2 files, but no errors when I extracted the files...??

This is a large archive with lots of folders, any one else had this problem..??

Hi Charles,
[Hermes 1.04 locks up, TOS tells to use folderxxx]
>However, I have a 4meg STe and do not see why this should be necessary
>In fact, I think folderxxx causes trouble for my STe.
I'm afraid you're wrong. FOLDRXXX increases the internal memory pool used for file access and memory allocation (under DOS, you increase the values for the FILES and BUFFER variables in your CONFIG.SYS). Since Hermes does use a lot of files (1 article/message = 1 file), you'll have to increase the memory pool. That's what FOLDRXXX does. So put a FOLDR100 or something into your auto folder and things will work fine. Some hard disk drivers (ICD and HUSHI, for example) can also increase the number of folders.

>I am new to uucp and I may not have set this up properly. But
>I have no clue as to why it would lock up. In addition, all of
>the manuals(or most of them anyway) are in German. Are there
>English docs available? Could someone give me a hand in setting
>this up via email? or let me know what they think could be wrong?
If FOLDRXXX does not help, mail me your configs and an overview of your disc's folder structure and I'll see if I can spot a bug. I've used Hermes 1.04 for about 6 months and had no problems with it.

Currently I prefer beta-testing the new Hermes 1.10 (works great, but I'm afraid I'm not allowed to tell you any details) which will have english documentation. On the other hand, what about learning German [EVIL GRIN]?
/s/ Udo
PS: The 'b' in Hermes 1.04b means binaries, not beta. Yes, there is a source release of Hermes, but only for registered users.

>This would seem roughly the right time to create a comp.sys.atari.falcon
>newsgroup. As a lot of it is starting to become Falcon specific!

No, it's quite the opposite. From the Net's point of view,
it's about time to GET RID of some of the surplus newsgroups related
to Atari products. The last time I checked, there was only a trick
of postings in the "atari" area. As such, the "atari.st" areas
should be eliminated and all the "atari" groups should be consolidated
into "atari" groups.

As for the "Falcon specific" messages, almost all have been
the perhaps-interesting-but-actually-pretty-irrelevant postings
in the Falcon v. A1200 discussion. That's going to come and go
for the next few years no matter where you put it. Rather than
separating the Falcon discussion, it seems to me particularly important
to keep the Falcon and ST discussions together because we want *more*
common programs and hardware available for them -- not less.
And we don't need unnecessary duplication of discussions for things
that concern us. And yes, on some systems "cross posting" does
create the same messages on more than 1 area of disk storage, which
makes it *very* wasteful.

You have to think about "the good of the Net" and not just
"the good of your ego" as a Falcon booster.

I used to use AtariTeX (Stefan Lindner's TeX), rather than CS-TeX, fairly
happily on a 2Mb, single drive STe, with an 800K or so RAMdisk.
As long as you don't want to preview all the time (which you don't really
need to *that* much), it works fine.

CS-TeX 4.0 on a HD is _very_ nice though. It can get to be 10-15 MB,
depending on how many/which fonts you have installed i.e. 360dpi, 90dpi, and
how many of the more obscure ones you generate.

'ST Applications' (the ST Club's magazine) had a good article on how to set
AtariTeX up for 'small' machines some time ago.

Source record: 40207

Hello world!

I have Didot Lineart, Calamus 1.09 and Calamus SL.
When I load a PD postscript font into Didot and saves it as Calamus CFN 1.0
I can use it with no problems with Calamus 1.09, but it won't work with SL.
Am I doing something wrong or have DMC done something to prevent people
from converting postscript fonts?
Btw, the old Calamusfonts works fine with SL, but not fonts created with Didot.

It is FAR superior to any Atari so far released, there is a good chance that anything written FOR the falcon, will not work on previous machines, so, people in the standard group would have absolutely no use for any of the Falcon information unless they owned the unit itself.

It wouldn't exactly do a great deal of harm anyway - if you don't want it, don't subscribe, and you save money & time by not having to sort through the useless messages.

Does the ST support Dynamic Libraries like the Amiga, Windows or OS/2 ?
If it doesn't, why not ? If it does, why weren't they implemented ?
It seems with DLs programs would be smaller and since two or more
programs could use the same DL, they take less space. Also it would
less time to develop programs.

Give me a dollar comparison of the two and I think the answer could become aparent. :) TOS 1.4 _new_ can be had for US$59. The TEC board needed for installation of TOS 2.06 alone is over US$100.

BTW, how much are the 2.06 chips?

hehe... don't need to do that, I don't think.

I finished the re-implementation of rsrc-load() on the weekend. It works
GREAT. The big benifits are:

- Any number of RSC files can be loaded / freed.
- so multiple 64K RSC files give >64K RSC capability.
- Scaling is done using a more intelligent algorithm,
making it unnecessary to have multiple RSC files for
different resolutions.

>I think the only thing you can do to make it slightly safe is to check
>the version number word at the start of the file. If it doesn't match
>any version(s) you know about, pass the call to the original
>rsrc_load().

I thought about this, but I would expect that my rsrc_load() will indeed
work for MOST future possible RSC extensions.

You can get it from cs.ruu.nl (in the UNIX directory). It is in
source form only, so you'll have to port it (but it's not too
difficult I remember).

> >won't do that.
>
> "I never heard of it so it can't be so." What an enlightened attitude.

Ian, please read more carefully. I wrote that there probably is no such bug because I know that there are people who use two MFM drives inside a SH204, not because I never heard about any problems (though this alone would also be quite a good indicator, since I can count on the accumulated feedback from more than 10000 readers of my book).

> In fact there is such a bug in some early SH204 units.

There is a bug in the SH204 host adapter PAL, that's right. Its effect is that the controller never seems to report an error to anything you send to it, i.e. the status byte will always be zero. (Actually, the controller does send all the correct status byte, but they are lost on the way.) If you try to detect the presence of a second drive just from evaluating the status byte response to a read command, you're out of luck, and that's probably why ICD says it can't be done. If you have additional error checks in your driver, everything will work fine.

> My original SH204 would
> respond to any LUN number (0 - 7) on its controller, and that prevented
> ever adding a second mechanism, even though the Adaptec 4000 can handle
> two.

This sounds exactly like the problem described above, and it can be solved by additional checks in the driver software.

Its very simple this is the faulty part NO..C025913-38..

The chip that you need is NO. C398739-001A...

NOTE: the first chip C025913-38 is fitted to most ST's and Mega's, this chip developed problem with the New STE PCB board lay out, logic noise from what I have read about...

While this may surely be true, I have had the same problem which was really
caused by the upgrade. Two things went wrong:

1. I used fairly long fly wire to connect the upgrade (a 1040ST has little
room to intall a large upgrade board). When I moved the upgrade to a
better position using (much) shorter wires, things improved.

2. One address wire appeared to be OK when tested with DC, but broken for
high frequencies. A qualified computer tech found and fixed this for
me, and my ST is running fine for about two years now.

1160. More make problems with MDK

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-01 10:01:50 UTC
From: lynbech@daimi.aau.dk
Message-ID: <1993Mar1.100150.4661@daimi.aau.dk>
Source record: 40205

I am glad to see that I'm not the only one with make problems.

I too noticed the problem of finding executables, but it seemed that
it could be fixed by adding the complete path.

However, when having a rule like `all: $(OFILES)', make will just fire
up gcc on the still non-existing .o files rather than first bringing
each .c into an .o

Is this a `feature' of the ST port, the MDK version of make or the
already mentioned mfsconf problems?

The same makefile has been working with the sozobon make program, and
I wouldn't like to think that GNU make lacks standard rules.

>own port of make and compile it base-relative...
>
Hereby, I *do* react...
Some friendly soul sent me some patches to make I forgot to apply in the first place. This is why make does not know about the program extensions. IT'S MY FAULT! IT WILL BE CORRECTED!

Secondly, I messed up even more by *not* setting make's stacksize large enough. So, please set your stacksize to 32Kb, otherwise make will die on very large Makefiles (i.e., the mintlibs).

I do not know about the 'failing delimeters' bug. Please send me more info, and it'll be corrected soonest.

I promise to send a new version of make, one that recognizes the normal extensions, to atari.archive on Thursday or Friday. Hope this will help...

Bye, Hildo Biersma

Source record: 40221
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just found the following article in comp.os.linux, thought that it might be interesting for the Atari ST world, as well...

===== snip ===== snip ===== snip ===== snip ===== snip ===== snip =====

[Apologies to any of you who just saw this a few days ago. Several people mentioned _not_ receiving it at their sites, so I'm reposting it.]

The Official...

New and Improved...

Environmentally Friendly...

680x0 Linux FAQ (TM)

[Now legal in 40 states]

ABOUT THIS FAQ

This FAQ is intended to provide general information on the 680x0 Linux port project which is currently underway. Mainly, it's an attempt to cut down on the flow of email that inevitably comes in every time I post something about the project. ;)

WHEN WILL 680x0 LINUX BE AVAILABLE TO THE PUBLIC?

I don't know. A couple months, maybe. We're working hard on it at this point, and advancing leaps and bounds (and a few stumbles). There's really no point to releasing the current system to the public. It's not useful, and only occasionally even mildly entertaining. ;)

WHAT IS THE CURRENT STATUS OF THE PORT?

We're still working on the basic kernel at this point. The scheduler, memory management code, interrupt code, filesystem code, and handful of drivers have been implemented. There's not much to see right now. The system comes up and goes through some of the startup process, then sits there and idles at you. ;)

WHAT PLATFORMS WILL IT RUN ON?

The Amiga port project is the only effort to port Linux to a 680x0 platform that I'm aware of. However, we are paying attention to portability where possible. It is our intention to cooperate with other groups willing to work with us.

I expect that once we make our first public release of the system, several groups will begin porting our sources to various platforms. Interest has been shown by Atari programmers, mostly. There are also a few people hoping to bring Linux up on Sun 3's. I haven't heard from many Macintosh folks. In all probability only the startup code, interrupt code, and drivers will need re-writing to get the system running on these systems, or any others with the necessary basic hardware.

I'm aware that the phrase "necessary basic hardware" begs some explanation. Simply put, that would be a machine with a 68020+68851, 68030 (non-EC model), or 68040 processor, at least a couple megs of RAM, a good amount of hard disk space, and obviously some form of text i/o device (i.e. you technically don't even need a display and keyboard if you can plug a terminal into it).

There _has_ been talk of a port that could run on non-MMU-equipped machines as well, though it would lack the obvious features inherent in a memory-managed operating system (e.g. true virtual memory, memory protection). There is currently no effort underway to implement such a system that I'm aware of.

HOW COMPATIBLE WILL IT BE WITH OTHER SYSTEMS?

We, of course, hope that 680x0 Linux will be compatible (at the source level) with 80x86 Linux, as well as many other Unix or Unix-like systems. Linux is POSIX.1 compliant, which helps quite a bit with porting software to it.

Binary compatibility with _any_ OS other than 680x0 Linux ports is highly unlikely.

WILL X WINDOWS BE AVAILABLE FOR 680x0 LINUX?

I get this question a lot, so I figured it's worth having its own section. The answer is yes... probably... eventually. ;)

At this point, we have one volunteer to port the mono server to the Amiga version of Linux once the system is stable.

WILL THE AMIGA PORT RUN UNDER OR EMULATE AMIGADOS?

No. Actually, the latter is a possibility, I guess.

WHAT ABOUT MACH?

There is a separate effort to port CMU's Mach kernel to the Amiga and other 680x0 platforms. I'm not really familiar with their work. We've only stolen a little code from them. ;) Anyway, our Linux port is not intended to run under Mach. It runs "on the metal".

CAN I BE AN ALPHA/BETA TESTER?

We're not currently at a stage where we need any testers. (See above under the section CURRENT STATUS OF THE PORT.)

IS THERE A MAILING LIST?

We have a channel on the Linux Activists Mailing List called '680x0'
for discussion of the port. Currently, it's rather quiet. However,
it's the "official" source of information on the system. On the
other hand, any important announcements will also be posted to the
newsgroups in which this FAQ appears.

For help in subscribing to the channel, send an empty message to
<linux-activists-request@joker.cs.hut.fi>.

>FALCON, ST, or STE? DOES ANYONE KNOW HOW TO FIND OUT IF THE COMPUTER
>YOU'RE PROGRAM IS RUNNING ON IS A FALCON???? I NEED SPECIFICS! MEMORY
>LOCATIONS, CODE, ETC!!!

I can't give exact specifics (as I have yet to program anything much more complicated that "hello world" on my MSTE), but my first thought would be to check the COOKIE JAR - the STE and Falcon should have different values of I *think* the MACH (machine) cookie. The ST normally wouldn't have a cookie jar at all (though there are programs to create one I think). Off hand, I think that if someone is using TOS > 1.4, there probably is a built-in cookie jar.

Just a guess, but it's probably a place to check nonetheless...

1164. VME graphics cards

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-01 13:31:34 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1249@usdtsg.DaytonOH.NCR.COM>
Source record: 40234

I'm thinking about getting a VME graphics card for my MegaSTe, and
I was wondering if anyone out there in net-land (sounds like
Nickelodeon's "tv-land, huh? :-) has any experience with such cards.
I've had mentioned the Crazy Dots card and the AlberTT. The AlberTT
seems a bit more in my price range, so that's what I'm leaning towards
at the moment. What I need to know is experiences on the compatibility
of the various cards with software (typical GEM software; I know stuff like
games generally need ST LOW so I'm not concerned with that) - stuff
like Word Writer ST, Connect 1.92, and other such GEM software.
Also, what hi resolutions are available? (just one resolution, or
multiples). Basically, I wouldn't mind having something that just
gets me to VGA level (at least 640x480x16, though a 256 color mode
would be nice as well). Also, do these boards come with their own
RAM, or does it use up more of my internal memory?

Remember, I'm in the U.S., so I'm mainly looking at U.S.-available
cards...

Any help would be appreciated.

Robert Anisko
anisko@usdtsg.daytonoh.ncr.com

...would this information be in a FAQ somewhere? I've only read a little
about the above-mentioned two cards from some issues of Znet and AEO...

1165. u: bad sector on hard dsk

From: david schreiber <david.schreiber@canrem.com>
Message-ID: <1993Mar1.4019.10482@dosgate>
Source record: 40226

I have been having a problem sometimes when I try to write to my F
drive. I get an error message. A utility program has told me that the F
drive has a bad sector. Another utility program has told me that ithas
an orphan file at location OE93 (which means nothing much to me). My
question is - is there some way to repair that bad block on the F drive
which is interfering with write operations without reformatting my
entire hard drive?

```
>> [color indexes when writing to the screen]
> Well. Sigh. You shouldn't write directly to the screen. Use the VDI
> raster functions. :-)

Another myth. There is nothing wrong with writing directly to the
screen. Doing so is, in fact, the only way to get certain things done
with an acceptible level of performance. Can you imagine an animation
graphics program giving you an acceptible number of frames per second
playback using only VDI calls? Fat chance.

Once again, VDI is lacking in some basic functionality, and Atari hasn't
shown any signs of fixing that. Why is there no put_pixel call in VDI?
The closest equivelent is a 2 or 3 call sequence to write a polymarker.
Pretty slow stuff.

But even Atari recognizes this VDI shortcoming and allows for direct
screen access as a workaround. For example, consider this direct quote
from the Atari Falcon developer docs: "We do recognize, however, that
direct screen output is something that applications authors are going to
want to do. As a result, we are documenting the screen memory
organizations in all modes on the Atari Falcon030..."

Actually, I have seen many MORE configuration problems using PC's at work than with my ST system at home. This is mostly due to TSR type programs that must be loaded in a particular order to work properly (network drivers and the like).

Source record: 40229

> How to tell if you're running on a Falcon

Down with the tyrannical VDI-or-DIE faction! Here's some info that
should help...

To see what machine you're one, obtain the _VDO cookie. If there is no
cookie jar or no _VDO cookie in the jar, you're on an ST. Otherwise, the
_VDO cookie will have the following values:

0x00000000 - ST
0x00010000 - STE
0x00020000 - TT
0x00030000 - Falcon030
any other - unknown/non-standard video

(You should examinine only the high word of the cookie value, the low
word might contain a "minor part number revision" which is not important.)

> how to change palette regs on a Falcon

When you're in a Falcon video mode (not an ST-compatible mode), there are
two new XBIOS functions:

VsetRGB - XBIOS opcode 93

void VsetRGB(short index, short count, long *array);

Set 'count' colors starting at 'index' to the RGB color values indicated
in the array. The format of each longword in the array is 0x00RRGGBB.
The high byte of each longword is currently ignored, but may be used for
alpha channel data in future machines, and should thus be set to zero for
compatibility.

VgetRGB - XBIOS opcode 94

void VgetRGB(short index, short count, long *array);

The opposite of set; this retrieves the current palette settings into the
array.

Unlike the old Setpalette() call, in which the new colors took effect at
the next vblank, changes made via VsetRGB() take effect immediately. Or
so I've been told, I haven't tested that for myself.

I do not know if there are HD wrecking STes out there, but according to ICD you SHOULD NOT USE their ORIGINAL host adapter with an STe, regular or MegaSTe, or the TT. If you have any questions contact ICD.

I found out the hard way and lost most of my boot partition last year when I bought my TT, and tried an original ICD Host Adapter. ICD still has an exchange policy on their original Host Adapters. (your original adapter and $65 US).

l>The drive just spins and won't read anything. Does anyone know what is
l>wrong??

Maybe he connected the drive with the cable twisted. Orientation of pin 1
(colored wire) varies on different types of drives!

Then, the SF354's PCB doesn't connect the "Side 1 Select" line to the drive.
You'll have to add a jumper wire there.

f>My friend is going to purchasing a Falcon as soon as it comes out, and
f>was thinking about getting a VGA monitor for it. Until then, he wants to
f>know if he can hook the forthcoming VGA monitor up to the ST. Anyone
f>have any solutions to this?

All you must do is:

- buy a VGA monitor 30-38 kHz hor. frequency multiscan
- solder an adaptor cable, connecting:
. R, G and B lines to the ST's mono output
. ST's monitor dectect line to ground
. Hsync to Hsync and Vsync to Vsync
. GND to GND

and go ahead with ST mono display on your color VGA monitor.

For a Falcon, better buy a monitor with a wider frequency range (30-40 kHz or
15-40 kHz if you can get one) for extended resolutions and frame rates up to
78 Hz (Yes! I've seen it - it works!)

>any problems!? Seems odd!

In theory, it is possible for a faster RAM to cause problems in a system that was designed for slower RAM (really!). I experienced one situation (NOT on an ST) where one manufacturers RAM would work, another's would not (intermittant errors). Apparently, the "BAD" RAM had a much sharper switching transient, causing more ringing and ground bounce, thus causing corrupt data. I would say that, at least in theory, this is also a danger when going to faster RAM. Let me repeat, this is in THEORY! I have not experienced this with the ST line. If the RAM circuit is sound enough, with proper safeguards against ground bounce, etc, no problem.

Regards,
Doug Sr.

>I also rely pretty heavily on extended object type values, and if those
>get messed up the program will break.

Egad. This is a tad over-protective. I too make heaps of assumptions
about the orders of objects. But if a user wants to fiddle with the RSC
file, they'd better not change the ordering of ANY object, since of course,
we all use the RSC indices to refer to our objects. A new object added to
a form [and the sorted] will of course ruin this.

HOWEVER, if that's what the user wants to do, then too bad for them. If they
are pulling out a RSC editor on the RSC file then they should know what
they are doing (or simply make a back-up).

ALSO, the ORCS RSC editor has a "protection" mode that ensures the RSC is
only modified in ways that are highly unlikely to effect the application.

The MAIN reason I have for using external RSC files is that some of the
best GEM applications have come from Europe - I'd hope that my applications
could be easily user-adapted. Kind of giving back to the Euro atarians.

Probably a good technique.

>so, what is this location?

Shiver. Too many occirrences of "memory location" for my tender eyes.

Why do people use pure ASM? ASM is great. You can do AMAZINGLY fast stuff,
but for the bulk of your program, you can just use C (or better, C++). There
are library routines to do all these things, and heaps more.

Pure ASM programs have had their day. Now they are just a pit of
incompatibility.

There is NO REASON to use ASM, unless you have a 0.5 Meg machine with a
single-sided drive.

Take a screen capture and save it as a DEGAS picture (or if it's
already, in DEGAS, you're laughing)... now convert it to IMG using
GEM-view (on atari.archive or GEnie).

> I thought there was a utility or routine to convert DEGAS images to IMG
> format If so, wouldn't you lose a lot of clarity since DEGAS is just a
> bitmap image?

IMG is also a bitmapped format, it's just compressed a bit better than
DEGAS Elite images generally are.

Touch-Up and several other applications will also create .IMG files.

>I'll just use Supexec...

If your supervisor routine is short, you won't notice much slowdown
besides the overhead of calling the OS. Just keep in mind that while
your process is in supervisor mode your process will not be pre-empted
by MiNT, so you shouldn't compute any fractals while checking the
carrier detect status :-)

Cheers,

1184. How to compiler MiNT 0.99 with Pure C ?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-02 08:01:06 UTC
From: PAULETTI@biel.be.tech.ascom.ch
Message-ID: <1993Mar2.080106.13444@hasler.ascom.ch>
Source record: 40147

Hi there

Over the weekend I tried to compile MiNT 0.99 with Pure C.

I had to discover that the C source file will not compile
under my Pure C, even I found in the code some __TURBOC__
defines that should make the code compilable under Pure C.
I encountered two problems.

1. in mint.h an include file "osbind.h" is wanted. My version
of Pure C does not have this inlcude file. Hence I used
tos.h instead.

2. To get rid of the undefined ushort I have to set the define
GENMAGIC. If I do this I get another error or warning that tells
me that GENMAGIC has a wrong value.

Did anybody of you have the same problem and did anybody compile MiNT
0.99 successfully with Pure C.

Any suggestions welcomed

andreas pauletti

1185. Z80 emulator is 68k?

How many users even *have* the capability of modifying a resource
file? Readers of this group are probably not a fair sample of the
population, and I would bet that most users do not have a resource
editor.

Even so, I prefer separate RSC files, if only so I can correct the
spelling in the text.

I think that DMC felt that the makers of Didot Lineart were infringing on DMC's copyright when they included the Calamus font format in their product. Maybe DMC made SL not to accept fonts created with Didot?

I use "PCG Font Designer Plus" for PS2CFN conversion and every single font works fine with both 1.09 and SL. I think you will be able to find PCG's adress in ST-USER. If not, you could get it from me, but I have it at home - mail me if you can't find their address.

> LOCATIONS, CODE, ETC!!!

No need for shouting, we can hear you 8-)

To check whether you're running on a specific Atari computer, you'll
have to examine the cookie jar. The cookie jar is a sequence of
"cookies" in a reserved area of memory. Each cookie consists
of an ASCII ID (4 byte) and 4 bytes of data. The cookie sequence
is terminated by a "null cookie", i.e. one with an "ASCII ID" which
contains null bytes only. A pointer to the cookie jar is installed
at $5a0.L. If you find a null pointer there, there's no cookie jar.
Since all TOS versions starting from TOS 1.06 install a cookie jar
at boot-up time, you can be sure that the Falcon TOS will install
a cookie jar. In other words, if there's no cookie jar, you have
a plain vanilla ST or MegaST.

After you found the cookie jar, you have to look for the "_MCH"
cookie. Check the first four bytes of each cookie in the cookie jar
for equality to "_MCH". If they match, the next longwork contains
a machine ID. Unfortunately, I can't remember right off my head
what machine ID the Falcon has, but maybe other netters can help
me out here. If you can't find a "_MCH" cookie at all, it's probably
best to assume you're on a standard ST or MegaST.

The complete cookie jar description can be found in the TOS 1.06
release notes which are part of the Atari developer package.

> it's just one more thing he/she can screw up. Then we get calls like,
> "I just bought your XYZ program and the &%#@ thing won't work!" <groan>

It shouldn't be too hard to tell folks that there is an RSC file to go with the PRG file, no? I, for one, prefer being able to switch languages by just swapping resource files. Certainly beats hell out of having to recompile. Besides, there are packages that come with an installation procedure to make sure things like that don't happen.

> 2) Some programmers, myself included, do not really WANT users mucking
> around in my resource files. As mentioned earlier, if the sort order of
> resource tree objects gets out of whack, the program may die. And besides
> that, I'd rather users did NOT change my copyright notice or other info in
> the resource file which I felt was important when it was coded.

Well, I tell users that, when they actually change the resource file, they're on their own when things break, so they had better know what they're doing. As far as the copyright notices are concerned, what about people poking about in the executable with a disk editor? Your copyright notice doesn't look much safer to me there. Of course, if you're paranoid, you can encrypt the notice to make it harder to find, but then what's to keep you from comparing the copyright notice in the resource with an encrypted version when your program starts up, just so you know it's still there?

The only reason for embedded resources I can see is with accessories. Now that accessories are on their way out, this doesn't look too important any more.

So go ahead and embed your resources into your PRG files. That's all right. You're only going to do an English version (or German version, as it were), anyhow. And it's a good thing that people can't change the name of who produced the thing. Or can they? Embedded resources suck. Period.

Message-ID: <C39qC9.A96@cck.coventry.ac.uk>
Source record: 40146

I am looking for some help. I have in the past obtained a document containing information as to the bitmap file formats. What I was trying to locate is a similar document containing the Vector file formats of the common and not so common packages,

Such as Calamus, .GEM ..... etc.

also The vector formats for some of the Font Systems,

Such as Calamus, Abode, etc.

All file formats are required from various machines for the construction of a package that will enable the users to convert fonts and vector files as well as the standard Pic Switch 0.7 collection.

Any information would be greatfully received.

Many Thanks,

Simon

Only one thing to recommend here - don't waste your time looking.
You've already found the problem with these type of programs , they all
drop characters and garble others. The reason is that they setup the 68901
into synchronous mode, when you want it in asynchronous mode.

1197. Questions about OVERSCAN

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-02 16:52:58 UTC
From: aburgh@iastate.edu
Message-ID: <aburgh.731091178@vincent2.iastate.edu>
Source record: 40154

Hello all,

I recently downloaded the files from atari.archive for adding overscan to any ST. The modification sounds simple enough, but I would like to know how well it works and how compatible it is before I go ahead.

I am most concerned with overscan working with Toswin so it would be more practical--does it? Also, does the previewer included with CS-TeX work with overscan? Let's see...what about Uniterm and Connect? I currently use Uniterm, but would probably switch if I could have a full 24x80 screen in a window.

One more question. I don't have a schematic for my Mega ST nor do I know which chips are the glue and MMU and what the pinouts are. What I do know is that pin 20 on the 68901 is the DE line and the composite sync is supplied to the video port. I'm assuming that I can figure everything out by tracing the lines know, but if someone can tell me exactly which lines on which chips to use I'd be very appreciative.

Thanks,

Aaron Burghardt

>from evaluating the status byte response to a read command, you're out
>of luck, and that's probably why ICD says it can't be done. If you
>have additional error checks in your driver, everything will work fine.

In this case the 'driver' software in question wasn't a vendor-supplied
driver. I verified this situation with my own code, which accesses ACSI
devices directly through the DMA chip. (I wrote a program that can backup
and restore non-DOS parts of a hard drive, such as the partition boot sectors,
badsector data, and partition map. It can do so without the presence of a
normal device driver, because your normal driver probably won't boot if
physical sector zero on the HD has been zapped.)

My program verifies the Tandon's behavior not just be checking the status
code from a seek or read operation, but by actually performing disk I/O
successfully. For example, I can backup the partition map by asking for
LUN 0, then format the drive specifying different partition sizes, then
restore the old partition map to LUN 1, and the drive successfully
returns to the old partition sizes.

k> Atomic v3.0 or above
k> Pack-Fire any vers,
k>
k> and anything else that is great.

None of those are particularly spectacular either. What you want is PFX-PAK, which comes with quester's LHarc. (ie in any of the LHarc 2.01 distributions)

As far as compression goes, it's the equal or better to all of the above, compression and decompression speed is better than any of them (it took the Pompey packer 1.9 over 8 hours to compress calamus 1.09, and PFX around a minute... and still got it more than 10% smaller 8)

Not only that, should you need to, you can _decompress_ PFX-packed programs with LHarc, something you can't do with most of the others. And it's also the only one I know of that works on the TT. (which is very important for me ... I usually delete any uploads to my BBS that are packed with anything other than PFX...)

k> thanks,
k> Karl.

\`miff` /|\

k> P.S. Has anyone seen a Falcon 030 down in OZ yet? PRODUCTION models?

Yeah, we had one at our user group meeting last night - _very_ slick piece of hardware. Quick, _quiet_ (you'd never know there was a HD and a fan in it) and very compatible. (more so than my TT 8( )

(plug)

Why not give my BBS a call?

Later...

Could be - although it's weird that IDcheck finds it but ICDfmt doesn't.

You might want to harass DEC for details on the jumpers on the drive - what
they do etc.

Does the unit actually spin up when you apply power?

Is there another brand on the drive? (I find it unlikely that the drive is a
DEC unit - more likely it's a rebadge of another brand...)

l> SF354 mech). The drive just spins and won't read anything. Does anyone
l> know what is wrong?? I haven't seen it in person, so I don't know first
l> hand what the situation lookslike.

Well, part of the problem is the board in the back of the SF354 case, which is only needed for the SS mechanism. (this is the board with the 8048 mask-rom microcontroller which does silly things to the signals going to the old SS drives. You _can_ get around the problems, but you need to do _major_ butchery on the board. (eg. step 1 is to remove the chip 8)

If you can't get advice closer to home, mail me.

ws> So, one bank of 120ns chips, and another bank of 90ns chips won't cause
ws> any problems!? Seems odd!

No, you just don't understand what the numbers mean.

The speed rating on a DRAM is the amount of time it takes for the chip to dig up the data that you have addressed, and present it on its output. It doesn't matter how long it has to stay there. So what happens if you mix 120s and 90s? well, the 90's have their data ready first, followed about 30ns later by the 120s (the times aren't very precise either - 90 is anything less than 90 but more than 80). However, the 68000 won't even try to read it until enough time for a 150ns device to be well and truly ready.

So, all that happens with the faster devices is that they spend longer waiting with the data ready. Big woop.

wells_s@kosmos.wcc.govt.nz (Steve Wells) writes:

>Not a very helpful way of looking at things.

I figure that if a user has the nous to pull out a RSC editor, then they know what they are doing. I also assume that they can equally well pull out a binary file or sector editor and change any copyright notices.

There's another use for RSC files that hasn't been mentioned yet...

... many programs can be given a new lease of life by adding "3D" effects to buttons, etc in the RSC file, as well as adding colour. If you have a Falcon, or a TT, you can modify many RSC files without causing any troubles for the program (keep a back-up of course!!). On a TT you can add colour to the RSC and on a Falcon, you can also set the flags for 3D effects (flags 9 and 10 is it?).

Thanks, but I've taken a previous person's advice and am using vs_color()
to set the colors because I figured out how to convert VDI color indexes
to Raster color screen indexes. This is good because it allows only one
setcolor command for all the machines the program runs on...ST/TT/STE/Falcon.

DON'T do it. The ST power supply is barely adequate to power the ST and
costs far too much to replace. You may have no trouble, but it is not
a good idea.

Hi there,

I just lost all the stuff on my SCSI HDU
obviously I did backup just some of my files.....

To avoid again this pain I wonder if there is
any P.D. programs that allows to backup files
on to a SCSI streaming tape.

Thank you.

...
*The problem with such an operation is more one of finding an acceptable
*semantic than implementation - if someone writes a mouse accelerator - you
*want it to _always_ catch the mouse packets, regardless of which process is
*current. When it installs itself, you'd have to either notice, and try to
*guess whether you should install this vector for all the other trap-maps
*(neat term that 8) you have scattered around...
*
*Or, you make it impossible to do things that way, and force people to use a
*new system call to install global traphandlers. (my personal preference
*anyway)
*That's fine, but a big compatability hit.

I think system calls to install traphandlers is an EXCELLENT idea.
That way, an application can just say "let me see buserrors too" and
doesn't have to worry about keeping track of which other app. was
installed immediately before, or whether it even makes sense to
restore that previous application, cuz it might have been killed
previously. Apps won't neccessarily be installed and de-installed in
a tidy LIFO manner. The traphandler installer syscalls would just
maintain lists of which apps were plugged in, and delete them or
insert them into the list as appropriate (changing the appropriate
spots in the apps, as neccessary).

1215. MDK and MEGA ST 1

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-03 13:28:10 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <1993Mar3.132810.21732@sol.ctr.columbia.edu>
Source record: 40171

I've just had a mail message from someone who's tried to install the MDK onto a mega ST-1 (upgraded). I don't know if he's using the very latest versions of the software, but SETUP managed to wipe out the directory C:/mint without telling him. Since he apparently stored a lot of programs/information in this directory, he wasn't pleased.

I would urge anyone using these programs to make sure they have a backup first. I *hate* receiving mail from people telling me that I've just trashed their hard drive - it makes me feel *really* guilty. I'd hate it to happen to me.

This is the first time I've heard of SETUP or INSTALL actually deleting peoples files that they couldn't recover, but nonetheless, PLEASE take heed of the above paragraph.

As an aside, the main problem areas do seem to be on mega-ST's. I don't know why - they run TOS 1.4 (AFAIK), which is damn near the same as TOS 1.6 in my STe, which works perfectly.

Simon.

> --
> Mark Lehmann Senior Texas A&M University
> lehmann@cs.tamu.edu

There may be a number of reasons:

1) Your fan was connected to the +12V rail, and since computers usually don't regulate the output from this supply, you may easily draw current from it.

2) The +5V rail has circuitry on it (one would expect!) that regulates the voltage, cleans up transient noise(s), and filters out RF noise as well. If said circuitry _also_ had to supply much current with all this protection, it would get pretty hot, or it would need to fit into a larger or external case.

3) Dynamic memory acts as though charge is being stored on miniature capacitors inside the RAM chip. Inside each chip there must exist one of these mini-capacitors for each _bit_ of data. Now, every capacitor ever made has had some leakage current associated with it. This means that after a period of time the capacitors would slowly discharge and "forget" what was placed in memory! To overcome this, circuitry inside the chip is arranged to "refresh" the stored (memorized) charge. Since these capacitors are small and can't store much charge, this means that the memory (ALL 4M-bytes * 8 bits) has to be refreshed _many_ times every second; resulting in increased power consumption. This would be considerably more power than a like number of good CMOS chips or ROM's would use.

I heard the same. When I upgraded my JRI board from 2.5 meg to 4 Mg this last Christmas my machine would not boot and it displayed all types of weird colors on the screen.

I took it to my dealer (yes this small town of 50,000 people has a certified Atari Dealer) who told me it was the power supply. I read in the JRI manual that the symptoms I had were a fan-in/fan-out problem with the video chip. My dealer installed lower power memory and the problem disappeared.

Next he added a TOS 2.06 board in addition to my PC-Speed board. This did not cause problems with my power supply.

Last, I added a DC fan from my dead Supra 60Mg hard drive case. I soldered it to the 12V+ and GND connections on the power supply. Still no problems.

So while the Atari power supply is week, it powers 4 extra devices on my computer and still works. The fan keeps the power supply at a constant temperature which is cooler than the power supply was before I added any components to the machine. I think that the fan is keeping the power supply from burning out.

Can any experts explain why my machine can handle so much and why I had power supply problems when I added memory, but not when I added a fan or a TOS 2.06 board?

> TOS 2.06 board?

I'm no expert, :), but the ST supply is week in the area of 5 volts,
it actually is running around 4.75vdc, Each additional load draws the
voltage down a little. You TOS 2.06 board actually could reduce the power
supply load since you probably removed six ROMs, TOS 1.x, and added
two ROMS, TOS 2.06. Your fan is running off the 12vdc supply and has
no real effect on the 5vdc supply.

From: kendall@NeoSoft.com
Message-ID: <C3C8pq.8vv@sugar.neosoft.com>
Source record: 40185

Well, I already have pieced together the SCSI ribbon/50 pin centronics
cable, so now I have the equivilent of an external SCSI...

Now, does the Falcon have a SCSI-II or just normal SCSI port on the back?
I had thought it was SCSI-II, and if it is, where can I get a cable to
go from SCSI-II to SCSI?

P.S. - I was also thinking of becoming a falcon developer for the docs -
could someone please tell me (by mail) what kind of things you get for
becoming a developer, and also if developers get discounts on hadware?
I'd hate to buy a Falcon then become a developer, only to find out it
would have been cheaper the other way round...

Thanks,

```
--------------------------------------------------------------------------
NOTE: THIS IS A NEW CALL FOR VOTES, REPLACING THE OLD ONE WHICH WAS
*NOT* VALID!!!
IF YOU HAVE VOTED FOR THE OLD ONE, YOU MUST VOTE AGAIN, SINCE ALL
PREVIOUS VOTES HAVE BEEN CANCELLED!!!!!!!

SORRY FOR THIS INCONVENIENCE...
David Oakley, Proposer
--------------------------------------------------------------------------

FIRST CALL FOR VOTES
====================

This is a Call for votes on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Charter
=======
This group is a forum for discussion of topics in connection with the Atari
range of computers - marketing, capabilities, comparisons and other
arguments... It will move discussions of this nature from the existing
comp.sys.atari.st (and atari.8-bit) newsgroups, which will exist for a more
advice orientated discussions.

Users will be requested to not post the above discussions in the existing
newsgroups if advocacy is formed.

Rationale
=========
This group will separate a section of discussion, mainly from the current
newsgroup comp.sys.atari.st but also relatted topics including the Atari 8-bit
range of computers (atari.8bit) and the new Atari Falcon computers.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.
```

New users and people who need information about the Atari ST/8-bit computers
can continue to use the original group and would hopefully get more
attention if there is less advocacy mail present.

Voting
======
VOTING PERIOD IS:
appearance of this message
to 1st April at 9:00 GMT.

HOW TO VOTE:
1. REPLY to THIS message.

2. send your votes to:

dxo@cs.bham.ac.uk

3. if that doesn't work, try:

dxo%cs.bham.ac.uk@nsf.ac.uk

WHAT YOUR MAIL MESSAGE SHOULD CONTAIN:

For a yes vote:

I vote "Yes" for the creation of "comp.sys.atari.advcoacy"
VOTE: lastname, firstname [email address] : YES

For a no vote:

I vote "No" for the creation of "comp.sys.atari.advcoacy"
VOTE: lastname, firstname [email address] : NO

Your message must be of THIS form, especially the second line since
my vote counting software needs bothe the 'VOTE:' and the ': YES/NO'.

Rules on voting
===============

Voting Rules:
-Only one vote per user (Two different people cannot vote under the
same user name).
-Any votes which are received before or after the voting period
will be discarded.
-Any vote which does follow the above examples specifically,
will not be valid.
-Anyone who wants to change their previous vote may do so by voting
again. They must indicate that they have previously voted and are
changing their mind in a footnote. A changed vote will discard your
previous vote.

Ambiguous Votes:
Ambiguous votes -- those who do not follow the specified format, or
do not make clear the voter's intent, will, where possible, be

returned to their senders for clarification. Ambiguous votes which
cannot be returned to their senders or for which no clarification is
provided will be identified in vote mass acknowledgements and in the
final vote tally.

******* ANY PROBLEMS, MAIL THE ADDRESSES ABOVE! *********

Thanks to Danny Richman for the basis of this CFV!!!!!

1228. Kermit 5A

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-04 08:50:20 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1n4fsclNNt0g@golem.wcc.govt.nz>
Source record: 40182

Can any one get the Kermit 5A files from Columbia
and post them on A.A.

From what I know there is only FTP support on Columbia,
no mailer...

There is no other protocols that lets you do wild cards,
like dnloading lots of Uencoded files...

Roger.............. sheppard_r@kosmos.wcc.govt.nz

1229. GEMRZSZACC

Newsgroup: comp.sys.atari.st.tech

I think this is the author of GEMRZSZACC, Michael Ziegler,
how do I contact him so the I can get the latest versions
of RZ/SZ and the ACC version.

I did read some were that is now 30DM, but does that include posting/disk etc..

I don't wish to send a bank cheque to a old address..

So chaps help me with his new or old address and how much I need
to send him...

Thanks...........

Roger.............. sheppard_r@kosmos.wcc.govt.nz

But programs are supposed to be upwardly compatible, or something like that.
Things of interest to ST,STe owners are quite likely to be of interest of
Falcon owners and visa versa. This would be like having comp.sys.amiga.a500
and comp.sys.amiga.a1200 (or whatever they are called).

Another group isn't needed, but the name of the group should be perhaps
changed (in principle) to comp.sys.atari.computers

Oh well.

Mark

] >before they can even get one..... (But, what the hey...)
]
] Pardon? What about the Falcons that are sold here? What does 'full relea
] mean to you?

The Falcons you are seeing, are probably the ones from the dodgy-factory (hence the large number of people having problems with them).

Full release is when thousands are freely available to the public, and Atari has officially released them as such. (Which should be around the 25th of this month knowing them). Thousands are not freely available, here & there a few dozen are slipping through. (Atari are releasing some to keep people thinking 'they are here, I'll order mine'. But chances are, these are the ones that tested OK at the original factory. But, I wouldn't put down money on the reliability of these first models!

The ones released this month (or so said), will have all the trimmings, all the latest bits 'n' pieces, and you should even see some advertisements about the things!

Doesn't worry me however, as This country isn't getting any!

> Does the Falcon have a SCSI or SCSI-2 port?

SCSI-2.

> Where can I get a SCSI-2 to SCSI cable?

You should be able to get one wherever you find products for Mac or NeXT computers. At least, I've been told (by Atari) that both those computers use the same sort of SCSI-2 connector as the Falcon. Just tell them you need a SCSI-2 DB50 to SCSI C-50 cable.

1241. HSC v2.0

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-05 05:44:49 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Mar5.054449.21787@mnemosyne.cs.du.edu>
Source record: 40097

You're probably asking yourself, "What has Ian done such that the HSC version number has suddenly jumped from 1.40 to 2.0?" The answer is simple: long external names.

Today I fixed things up so that external/global identifiers are significant to 21 characters instead of the old 7 characters. What I want to know is: Is this enough? I could extend it to 35 chars, but it would be a good deal more work.

I have this gut-level feeling that 21 chars is good enough. But I figured before I cast it in stone, I should solicit opinions. Bear in mind that if the overwhelming sentiment is for more than 21 chars, it's gonna take longer before v2.0 can be released.

This started out, BTW, as a v1.41 release to fix bugs that have been reported to me since I released 1.40. But, I had allotted two days for getting my newly-acquired dLibs source to compile clean, and it only took one day, so I spent the extra day doing the longer-names upgrade. (This implies that for the first time ever, I'll be able to release library sourcecode along with the next compiler release. Finally.)

(In case you're wondering, I did NOT use the brain-dead SozobonX symbol format hack from Sozobon v2.0. If demand is great enough down the road, I can probably fix LD to read existing modules with SozobonX format symbols in it, but I refuse to make my system emit such symbols. They waste space, and require too much code to read/write the symbol table.) If anybody needs to know, I can post the symbol format I cooked up; it's much simpler to deal with than SozobonX.

>>from the Atari Falcon developer docs: "We do recognize, however, that
>>direct screen output is something that applications authors are going to
>>want to do. As a result, we are documenting the screen memory
>>organizations in all modes on the Atari Falcon030..."
>
>This is from the "Games" section...

No, it is not. It is from the chapter entitled "Video Documentation",
page Video.1. There are no words in the surrounding context that state or
imply that direct screen output is to be limited to games. There is a
recommendation that VDI should be used when practical, and that is
certainly good advice.

In the "games section" ("Game/Entertainment Software Guidelines", page
Guidelines.7) there is no mention of the concept of direct screen writes.
It does recommend that such software be designed to run in a window when
practical; again good advice.

>
>Can any experts explain why my machine can handle so much and why I had
>power supply problems when I added memory, but not when I added a fan or a
>TOS 2.06 board?

Yes - a) The orginal JRI memory upgrade was incorrectly fitted or faulty, the
replacement chips were correctly fitted and sound.
b) At some stage in your ST's logic circuitry there is a "weak link" which
means however much power is available to a chip it cannot output a high enough
signal to drive all your RAM chips and all the other conponents. Replacing the
RAM with one which used less power would then solve this problem.
c) Like JRI suggest it is a fan-in/out problem with the "video chip" and
the replacement RAM either had a lower fan-in (A special case of (b)) or a
higher fan-out (Unlikely this would be the problem really).
d) The speed of the orginal memory was wrong. Since it is now virtually
impossible to obtain memory that is too slow, the memory must have been too

fast, which although it *shouldn't* be a problem, the different characteristics of faster memory could cause problems on a system that was never designed to have its memory hacked around. I have heard of other people who had problems which went away after fitting slower memory.

Will packed programs screw up a MultiTOS/MiNT environment when using memory protection?

Packed programs need more memory than their executable headers indicate so we might see some problems there. I have always stayed well away from packed programs myself.

It is a very bad idea to grab system vectors without thinking of how
to get out of it again. A solution would be the following procedure:
if you has to grab a system vector from a program (of whatever kind),
DO USE xbra. When dechaining the vector, one searches through the xbra
list for the own entry point (check the xbra id AND the vector adress!)
Then modify the old vector in the predecessor's xbra structure (or the
system vector itself) to point to the old vector one has saved at
install time. If that is not possible, i.e. because a non-xbra program
has installed itself into the vector afterwards, there is no possibility
of unchaining oneself, so one has to stay in memory, at least is it
necessary to leave a dummy trap jumper in memory.

Source record: 40105

The RZ55 I wrote about previously does not have a jumper to force the drive to begin running at power-up (thanks for the hint Chris...). Instead, it requires commands to the SCSI board to do this. What I need to know is whether anyone has source/executable that will allow me to address the SCSI board via an ICD host adapter, telling it to power up the drive so that I can format and use the system.

Of course, it should probably be compilable into an AUTO folder program, since this means I can't autoboot from the drive at power-up.

Hints, tips and/or working code will be greatly appreciated.

: big bang).

Hi, (i am a bit late, but after all...)

as overscan doesn't allow setscreen (well it runs a physbase emulator...)
you must fool mint to think that it runs on a matrix card. The easiest way
to do this is to change mem.c around line 224. I set scrnsize to
0x7fffffffUL and scrndone to 1. this gets you a mint version which runs
with overscan and matrix cards, but it won't boot without the overscan
stuff switched on...

Yes, both the Unix DUMP and TAR programs are available for the ST (I use
them all the time). BTW, does anyone have a working CPIO (for tape) program?

Um, rather than changing the application itself, the app should provide an
entrypoint, and just RTS from that. The OS should either diddle the
stackframe so that the RTS falls through to the next entrypoint (that'd be
fine untill you had hundreds of entrypoints chained), or it should simply
JSR to each handler in sequence. (slower but more relaible)

l> a TOS 2.06 board?

Yup - the fan is powered from the 12V rail, so it's not loading the parts of
the supply that are under stress. A TOS upgrade board doesn't eat any sort
of significant power.

However, greedy DRAMs can use a _lot_ of power.

No, there are no serious problems with TOS 1.6 and HDs. You can have partitions of almost any size with it (as long as you don't break the 65536 sector limit; e.g. if you format with 1K sectors, the partition can have a capacity of 64 MB max).

p>1) Your fan was connected to the +12V rail, and since computers usually don't
p>regulate the output from this supply, you may easily draw current from it.

The +12V output is usually regulated, but not as good as the +5V output,
since the +12V supply is only used for the motors and magnets in
(hard)disk drives and is therefore not as critical. Usually, the +12V
supply has more reserves left than the +5V supply, which is usually near
the edge.

p>2) The +5V rail has circuitry on it (one would expect!) that regulates the
p>voltage, cleans up transient noise(s), and filters out RF noise as well. If
p>said circuitry _also_ had to supply much current with all this protection, it
p>would get pretty hot, or it would need to fit into a larger or external case.

The +12V supply has nearly the same filtering circuit, and the coils and
capacitors involved have a low resistance and do therefore not get very
warm.

p>capacitors for each _bit_ of data. Now, every capacitor ever made has had some
p>leakage current associated with it. This means that after a period of time
p>the capacitors would slowly discharge and "forget" what was placed in memory!
p>To overcome this, circuitry inside the chip is arranged to "refresh" the stored
p>(memorized) charge. Since these capacitors are small and can't store much
p>charge, this means that the memory (ALL 4M-bytes * 8 bits) has to be refreshed
p>_many_ times every second; resulting in increased power consumption. This

This is not the main problem with RAMs, the problem is that RAMs are
CMOS devices, which do not use much current in standby-mode (between
accesses, that includes refresh). However, when they are activated, they
draw a lot of current (some amps per 2MB bank!) for a short time, due to
the capacitors everywhere in the chip (not only the small ones in the
memory cells, the ones in the output drivers and the lines connected to
them are larger!) being charged / discharged depending on the desired
output state.
This current is reduced by the decoupling capacitors, but nevertheless
causes voltage drops across the traces on the PCB - and if the voltage
on parts of the computer drops too low, these parts will malfunction.

Another problem is that the +5V output of many atari power supplies is
at the limit, so every 100mA more (even DC) can be too much (If I
remember right, 1MB of memory draws about 100mA *DC*).

cu

1270. Spectre 128 <-> 720k ST floppy

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-08 03:46:36 UTC
From: boyd@gauss
Message-ID: <C3Jx5p.75w@mailer.cc.fsu.edu>
Source record: 40125

I have been offered a Spectre 128 w/ROMs for a very good price. I have a Syquest, and intend to devote a couple of 44mb disks to Mac stuff. My question is, what programs are needed to transfer files back and forth between a real Mac and an ST (with a regular DSDD floppy drive)? My understanding is that Apple File Exchange can be used to read/write to MSDOS formatted DSDD disks, given that the Mac has a Superdrive (is that correct?). What programs can be used to go the other way? Is there a program that allows Spectre to read/write to MSDOS formatted 720k disks? Is there a program that will make the Mac read a Spectre formatted floppy?

I am trying to acertain whether or not the Spectre 128 is worth even the small amount of money that is being asked for. Should I plunk down a few more bucks and buy a Spectre GCR? I have a Mega2, so this may imply diddling around with the drive shielding (which I would like to avoid if possible, hence the questions).

Also, my plan for major Mac file transfers is to take my Syquest to a Mac, hook it up, and blam away. Then, take the Syquest home and hook it back up to my ST. As far as I can tell, there should be no reason why this won't work. Does anyone disagree?

Thanks in advance. I will post a summary if there is interest.

BTW, have anyone else noticed that the classic irritating PC user question, "Yeah, but does it run Lotus?", has been replaced with, "Yeah, but does it have a cool screen saver, like After Dark?". Warp 9, baby.

Is the drive ID set to 6? That is reserved by the ICD clock. Are there other
SCSI devices online? If so, I would try removing them and experimenting with
jumper settings.

If at all possible, try to figure out exactly who made the drive (I think
DEC OEM's its drives). I have had excellent experience with calling up
drive manufacturers and getting technical help and manuals for free. Just
about all of them have 1-800 numbers, which can be found by calling
1-800-555-1212 (800 directory service). If all else fails, call ICD and ask
them! They have also been a big help to me in the past.

Well, the best disk tools are commercial. Cleanup ST (ICD) and Diamond Edge
are the two I have experience with, and they are both well worth the money
(I prefer Diamond Edge).

There are some PD disk fixers on atari.archive.umich.edu, but I have never
used any of them. Good luck!

Message-ID: <1993Mar8.093112.131217@mswe.dnet.ms.philips.nl>
Source record: 40051

Hello,

I am trying to write a programm that handles vector graphics and I want
to read .GEM files. Does anybody has any info on the structure of this
kind of files. Or as an alternative .CVG files (Calamus Vector Graphics).

The .GEM files should be able to hold bezier curves, so it should be at
least GEM/3 I think.

Anyone?

Marcel.

1278. [C-64] Rob Hubbard Music Sourcecode

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-08 09:54:58 UTC
From: u882859@postoffice.utas.edu.au
Message-ID: <1993Mar8.095458.19847@newsroom.utas.edu.au>
Source record: 40133

The sourcecode to the First Rob Hubbard music routine is avaliable
right now on the newsgroup comp.sys.cbm under the newsitem called
'C= Hacking #5'....there is also an explanation of how the sourcecode
works too...

This routine was used for such classic '64 tunes as Confuzion, Thing on
a Spring, Monty on the Run, Commando, Bump Set and Spike, Warhawk, W.A.R.,
Sanxion, Gerry the Germ, Master of Magic, Thrust, Flash Gordon, Zoids,
One Man & His Droid, Human Race, Chrimera, International Karate, Formula 1
Simulator, .. and more and more!! (about 30 musics).

The reason that I post this article here is because the '64 is pretty
old, and most of the people that will like to get hold of this
sourcecode will have other (more powerful) computers now.

This newsitem called 'C= Hacking #5' is actually a network magazine, and the
Hubbard source appears as the second article. The newsitem is _very_ big
(about 6000 lines and approx 200k) so make sure that your newsreader can
get the whole article...otherwise e-mail me on:
u882859@postoffice.utas.edu.au
and I will send you the sourcecode myself.

Thanks for reading, and I hope you enjoy this incredibly valuable
sourcecode :-)

(P.S. Anyone that wants to chat about ST and Falcon music too, then please write :-)
.I could also post some ST music sourcecode here too (mainly Count Zero and Mad Max I've
disassembled)

1279. MiNT and xcontrol, broken?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-08 10:23:52 UTC
From: lynbech@daimi.aau.dk
Message-ID: <1993Mar8.102352.22497@daimi.aau.dk>
Source record: 40134

Is the combination of xcontrol.acc and MiNT broken, or is there some other problem that I have been hitting my head on?

I eperienced loads of problem when trying to run MiNT (0.95)) mfs (0.55), all from MDK, and xcontrol (from a.a) at the same time. Programs would bomb, assert alerts and caches not written would flash across the screen, and trying to start gem or bootgem from a shell started by init would fail either immediately or quickly with bus/address/illegal instruction/segmentation errors.

I begna to suspect my accesories, and when xcontrol was removed, the problems disappeared. Even when only the mint prozess cpx was loaded, were the problems there.

Is this a known bug, or just because my xcontrol is rather ancient?

1283. Unformat for Atari ST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-08 15:44:45 UTC
From: lunnon@qut.edu.au
Message-ID: <1993Mar8.104445.64806@qut.edu.au>
Source record: 40127

I have notice a few requests for software to recover formatted
disks, HD partitions etc in the last few days.

Several weeks ago when backing up my HD I was able to accidentally
zap the root dirrectory and FAT on 2 partitions of my HD Ugh.
Unfortunatley this happend not to the original but to the backup
after I had low level formatted the main drive (the reason for the
backup) so I had no backup :-(.

In response to this I looked (very hard) for an "Unformat" program
ALA norton utilities for DOS to no avail :-(. So I set out to write
as a result I now have a program which can.

1. Recover files on a HD partition
2. Restore directory structure
3. Write a file containing all the information about the bad volume
that can be found.

Like most "Unformats" it does not do this perfectly because a lot of
guess work is involved, but for non fragmented, recursively written
filesystems it does work, I was able to recover about 60% of my files
but because I had my directory structure back I could now find out
exactly what was on the volume.

There are a couple of caveats.

When I "unformatted" my volume I ended up with a lot of 0
length files in subdirectories. This is a bit of a mystery because I
don't actually write any subdirectories to disk, so I cant have
modified them. I suspect chkdisk3 is the culprit, from its invocation
after a previous version of "unformat" which failed to correctly recover
some files. I think chkdisk3 "Fixed" the directory entries to agree with
the FAT (The incorrectly written one) thus when I came to recover again
there was no length to recover, I will verify this later but for now ...

2. Unformat does NOT understand 12 bit FATS so floppies are out for the
moment.

3. Of course you can only recover from a FAT and ROOT dir zero type format
and NOT from a low level or floppy format run to completion.

4. You will need a utility to copy FAT 2 to FAT 1 when you are convinced
the unformat worked, I will provide this eventually, this is a safety
feature as FAT 1 is left valid in case you UNFORMAT the wrong thing FAT
1 will represent your original disk structure.

5. Unformat will not fix partition tables or boot blocks use you friendly
neighbourhood hosts adapter utilities to do this first.

THINGS TO DO IF DEMAND EXISTS (In order of priority)

1. 12 BIT FAT support (Ie floppies)
2. Improvement of file recovery algorithm (now assumes contiguous files)
3. Selectable directory recovery algorithm (recursive or linear)
4. Improvement of directory cluster detection algorithm (reduce false alarms)
5. FAT syncronising (FAT1=FAT2) on request
6. WIMPing

THINGS UNFORMAT CANNOT DO

FILES in the root directory and SUBDIRECTORY names in the Root
directory cannot be recovered.

Recovery from LOW LEVEL formats may be impossible

Recovery of uncalogued objects is not possible.

In some cases disk clusters belonging to directories cannot be
detected automatically in any reliable fashion some files may be lost in
these cases (The instances are small)

With any file recovery algorithm on DOS or TOS boxes it is largely
a guess as to where the files are, most algorithms assume linear files but
there are a few optimisations that can apply in the case of a cross link,
namely that the earliest written file is contiguous and the later file
resumes after the earlier file ends. I don't use this yet so unformat's
performance on fragmented file-systems probably will not be good although
it tested OK on one of mine.

Unformat does write a file (currently to stdout) about the things it finds
particularly the directories and files it finds, this information is
enough to allow a knowledgable user to re-link his/her file allocation table
and root dir manually if you dont like how unformat did it.

I will consider releasing this as shareware if the demand exists, meanwhile
I will provide the raw programs (no fancy menus etc) on request to anybody
needing to urgently get out of trouble. After all when you already have
a zeroed FAT and Root dir, how can things get worse ?

For more information mail to

R.Lunnon@qut.edu.au

PS: There are no warranties either expressed or implied. I take no
responsibility for any damage caused to your computer or filesystems
through the use or incidental to the use of this program.

1284. Help needed ... using 2nd FAT

From: nelson@that_machine.PPD.Kodak.COM
Message-ID: <4633@eastman.UUCP>
Source record: 40139

I have a hard disk partition which developed a hard error right in the middle of FAT #1, and several backup programs I have tried have given up trying to back up the files covered by that area. However, according to disk editor programs, the 2nd FAT is readable.

I believe I once saw a program whuch would force TOS to use the 2nd FAT instead of the first. Does anyone know what program that was, or of any program which can do this? Many thanks.

Source record: 40048

ICD provides a set of routines that will allow you to send commands
to a SCSI device connected to either the dma port, or the SCSI port
on the TT/Falcon. Unfortunately these routines require the Personal
Pascal call frame. Fortunately I have written a set of routines to
change to call frame from the Pure C ANSI call frame to the Personal
Pascal call frame. This should be compatable with the gcc call frame
but I have not spent any time verifying this.

These routines require ICD software to be present to run, I have only
used 6.04 and higher.

You would need to write a program that would kickstart your drive, and
then "relog" the hard drives in the system, once your drive is up
and ready. If you want I can send you the ICD object module, and my
call frame conversion object module.

Frank

1291. Weird Problem Upgrading to TOS 2.06

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-08 18:58:46 UTC
From: wabe@ukc.ac.uk
Message-ID: <3309@eagle.ukc.ac.uk>
Source record: 40043

I recently noticed a most weird effect of changing the TOS from 1.60
to 2.06 on my standard STE (fitted with 4 Mbytes of RAM).

The installation went OK. As the newer chips had more pins than the
the old 1.60 ones, I had to do a little bit of soldering to relocate the two
little ZERO ohm "resistors" that (presumably) reroutes the supply voltage.

Anyway TOS 2.06 came up working as it should and all seemed as
expected. Only software change I've noticed is that, if in some programs
(specifically those compiled with PROSPERO Fortran 77) a division by zero
occurs, you were previously given an ALERT warning and offered the option
of continuing. Well, whichever way Prospero did this no longer works - TOS
2.06 will bomb you out with ERROR Code -1. Pity! - a definite MINUS for 2.06
in my opinion - but I digress from my main point!! which is... When I started
to save and read files off my floppy disk there was an awful "grating" sound
from the disk drive which I'd never experienced with the old TOS. Apart from
the awful noise, however, the disk drive did appear to work OK.

My first thought was "D_mn! I've damaged the disk-drive during the
installation process" - though I had been careful and could not remember any
single incident that might have done this.

To resolve this doubt, there was nothing to do other than open my
machine again and re-install the old TOS (1.60) chips (a little UNsoldering
needed) to get back to my original configuration. And, believe it or not,
the disk drive then behaved impeccably as it always had before i.e. NO
"grating" sounds.

So, I do not seem to have damaged the disk-drive and IT IS something
to do with TOS 2.06 that is causing this undesirable effect.

How weird!! Anyone out there with similar experiences and (preferably)
a solution? Or any theory as to what causes this?

One thought - I gather TOS 2.06 is only routinely fitted to the MEGA
STE which is a rather faster machine capable of going at 16 MHz. Could it be
that it is trying to read my drive faster than my (standard) STE drive likes?
The actual "read times" however appear to be pretty similar.

I now am in a quandary - should I use TOS 2.06 for its new features
and risk drastically shortening the life of my disk drive, or stick with my
old faithful TOS 1.60 (and continue to run the myriad patches POOLFIX etc.
at boot time to correct its well known bugs)?

Bothered & bemused, W. Alan B. Evans

Not in my experience. I've been running a 105 Mbyte Hard disk with
a 32 Mbyte (normal) partition and another 40 Mbyte BGM partition (sector
size 1024 bytes) for years now under TOS 1.60. I always run the POOLFIX
patch. Some PROGRAMS may have troubles with BGM partitions though - usually
the early ones compiled before very large hard disks became affordable and
(consequently) BGM partitions became common. As an example, Simon Poole's
REORG defragmenting program will not work on large (> 16 Mbyte) or BGM
partitions - Pity! as there appears to be no decent PD defragmenter.

Sincerely, W. Alan B. Evans

[stuff deleted decribing 'grating' sound from disk drive caused by TOS
2.06]

> How weird!! Anyone out there with similar experiences and (preferably)
>a solution? Or any theory as to what causes this?

This is indeed caused by TOS 2.06. What happens is that TOS 2.06 sets
the step rate for your disk drive to 6 ms. This rate is for use with
1.44 meg drives. This is what is causing the 'grating' sound you
decribed. What you need is a little auto program to set your
step rate to the normal 3 ms.

The CodeHeads TEC package includes a program to do this. I think it's
freeware.

Is there a GEM-based grep program available? Or barring that, one that is at least a bit desktop-friendly? (IE, has an option to hold the screen before exiting, and can output results to a file, since the desktop doesn't support redirection.)

(Am I the only one who wonders why, after 8 years, the TOS desktop still doesn't support basic things like env vars and redirection? It's no wonder the only folks left in the ST world are unix-head programmers; you almost have to use a CLI or write your own version of everything to get any real work done on these machines.)

I have just managed to get my hands on 'Turbo-Link XL/XE' But the software version is only 0.96. (Mostly German). Running the ST to XL conversion selction, results in an 'available in version 1.0 message.

Does anyone out there have, or can tell me where to get, a version of the software more recent than 0.96 (It was written in 1990, so it's not all that old!)

By,

M. Reitershan Computertechnik
D-5429 Meihlen/Taunus

Any help would be great, as it means I can *finally* get my print-shop libraries (all 8 disks of them) into Print-Master + format! (With a bit of work). Not to mention the loads of other goodies I can exchange back & forth!

E-Mail replies would be best, no point wasting bandwidth.

I can't answer your question directly, but I have an idea that may help
determine overscan compatability. Any software that asks what the
resolution is should work with overscan, so knowing if a piece of
software works with any of the optional graphics boards should
tell you if it will work with overscan. Is this reasonable?

You mean Turbo C, don't you? It has been upgraded now, and has changed name to Pure C. You can't get an English version, though, because Borland don't allow it, or something like that.

I really don't know if anybody in the UK has it. Anybody else?

1302. Falcon serial

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-09 11:21:00 UTC
From: Don_Maple@kr.maus.de
Message-ID: <A19357@KR.maus.de>
Source record: 40055

Howdy!

I'd like to run something by yous guyz...

Ever since I got my Falcon I tried to cajole it (legally) to do more
than 19.2 kbaud. This turned out not to be that simple (some German
programs here claim to do that). To cut a long story short I disassembled
XBIOS 15 to see "how the OS does it".

So, under TOS 4.01 the XBIOS 15 code starts out like this:
====

```
lea $0000165a,a0 ;IO record
lea $ffff8c85,a2 ;SCC <---!!! (like the dox say)
moveq #$00,d0
cmpi.w #$fffe,$0004(a7)
bne.s l0000018
...etc
```

Since about a month ago I switched to TOS 4.02 (RAM based) and I just
assumed that XBIOS 15 code was the same. So imagine my surprise when
the disassembly of TOS 4.02 revealed this:
====

```
lea $00000f72,a0 ;load RS-232 record address
lea $fffffa01,a2 ;load MFP base address <---!?!?!?
moveq #$00,d0
cmpi.w #$fffe,$0004(a7) ;return current baud rate?
bne.s l000266c ;nope
...etc, almost identical to the original ST code
```

Further snooping revealed more "undocumented features" with Bconmap.
The basic table contains 3 entries one for each MFP (6), SCC B (7)
and SCC A (8). When the system boots, however, Bconmap defaults to 7.
This is all fine and dandy but any attempt to change it effectively
disables the RS-232 port!!!

Current Bconmap code considers anything but 6 as invalid i.e. you
can invoke Bconmap with 6. However, you then end up mapping RS-232
routines to MFP code and the MFP on the Falcon is not connected to
the RS-232! If you then try to reset back to 7, Bconmap shouts
"only 6 is valid" and aborts!

So the bottom line is Bconmap has the capability of mapping onto other
channels, as long as you don't actually use it!!! :-)

A quick and semi-clean fix should look something like this:
(I say semi-clean because we should really count the number
of existing Bcomaps and then poke that number instead of 3 but
the following should be good enough while we wait for TOS 4.03.)

```
move.w #-2,-(sp) ;get pointer to bconmap table
move.w #44,-(sp) ;Bconmap
trap #14
addq.l #4,sp
movea.l d0,a0 ;address of maptab
move.w #3,4(a0) ;change number of routines to 3
```

The good news is that the SCC runs in "x16" clock mode, i.e. the
serial port can go 16 times faster. So in _theory_ using x1 division
mode the top speed _could_ be 1,996,800 baud, that's 1.9968 Mbaud.

Does anyone have any comments about all this?
Also, I haven't done MTOS yet... Anyone with words of wisdom on that?

Don

OK, I GIVE UP !!!

I've been trying to format/partition my hard drive (an atari SH204).

It's second hand, and the original formatting utilities (dated 1986) are corrupted. I got a hold of the latest distribution of AHDI, but when I try and format, I get a DRIVE NOT RECOGNISED error message.

I tried swapping the data file that came from the OLD distribution with the NEW one, to see if the NEW utility would recognise the HD then.

NOPE.

I tried to partition the HD without formatting first, but I got the error:

DRIVE FORMATTED WITH OLD VERSION OF HDX, REFORMAT BEFORE PARTITIONING

Blimmin' great !!

Can anyone send me a copy of the 1986 distribution of HDX that WORKS ??

Can anyone (ie at ATARI) tell me how I can make an ATARI HARD DRIVE compatible with an ATARI ST ?? (the program told me to contact ATARI !!)

Dave.

There should not be any problem with this. If there is Best Electronics sells a slightly beefed up power supply for $50.00 (US). ICD makes a micro host adapter and 3.5" HD mounting kit to mount a HD INSIDE your MegaST. Or at least they used to.

I have an STE with a SupraDrive 30 Meg HD (later converted to a 60 Meg with a Seagate ST177N SCSI drive).

Now I have a Fujitsu M2266SA 1.2 GigiByte HD that I'm trying to connect via the SCSI daisy chain, but I can't get it to work. I removed the terminator resistors from the Supra because the Fujitsu has them and is last in line. The Supra ID is SCSI: 0, Device 0. And I set the Fujitsu to SCSI 2.

But when I turn on the Fujitsu (with it's own P.S.), the Supra makes weird noises. Neither drive is recognized by the computer. If I unplug the Fujitsu SCSI cable from the Supra, and restore the Supra resistor terminators, I'm back online with that drive. I've tried the Fujitsu as both SCSI and SCSI-2. No luck. I also tried running the Fujitsu from the Supra power supply and controller, in place of the Seagate, but only the green light blinked (not enough power??)

Has anyone connected such a large drive to an ST before? Help!

Scott

1319. Using GDB, HELP!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-10 09:22:39 UTC
From: lynbech@daimi.aau.dk
Message-ID: <1993Mar10.092239.15605@daimi.aau.dk>
Source record: 40073

I can not figure out how get GDB to debug my files, and I believe that
I have looked in most of the obvious places for info.

I have compiled using -g and made a symbol file using sym-ld and an
executable using gcc-ld (options the same), I start up GDB, it loads
the symbol file alright, it accepts a breakpoint on main, but when I
type `run' it stops with a `signal 0 received in _start'. If I try to
`cont' it says `bus error reading to or from child memory'.

Is it me, my libs, my gcc or mint, that is the problem?

My setup is:
1040STe, 2.5Mb, MiNT 0.99, mfs 0.55, GCC 2.3.(1 or 2) (MDK patch disk),
MiNT libs and includes pl 30, GDB 18

Any help will be greatly appreciated. I am sick and tired of using
adb.

Hi

I'm researching human-computer interfaces and I was wondering
if anyone has ANY useful information on voice-recognition?

I've heard that no extra hardware is required for voice recognition on
the Falcon! Just some software for the 56001 DSP chip.
Is this really true?

Has anyone seen/heard any demos from this software? (if it's available)

i remember a line in the middle of the SCSI bus (forgot the name, sorry,
pleas look at your papers) which can be powered by each side. Only one side
should be enabled, of course! Maybe both of your drives try to power
the bus? There should be a jumper for that...

btw: running a 600Meg Siemens drive, works fine, fast and quiet with my 520ST.

Keep hackin'
Walter.

You might try to use toglclr.ttp to set the 'clear to tpa' flag
(or something like that), it solved some gdb problems for me once
for some older version.
Recently I had problems with gdb too
and the toglclr hack did not work any more either, so I ported
gdb to Turbo C (I like stupid projects :-) and found some things
that looked like bugs to me. I did not even understand that it had
worked once :-)

For the interested people:
when gdb catches the signal 0 (generated by Pexec when gdb starts
a child) gdb relocates internal symbols and places breakpoints.
At that point it has forgotten to relocate its breakpoint addresses
however, so the breakpoints are generated at the wrong address
(somewhere near NULL).
The fact that gdb cannot restart seems also like a kludge to me.
You simply have to relocate symbols and breakpoints again with
the difference in basepage addresses, and off you go.

>
>The CodeHeads TEC package includes a program to do this. I think it's
>freeware.

Thanks to you and others (sjkinneb@mtu.edu , gseto@biome.bio.ns.ca)
who Emailed me personally to point this out. It did indeed sound as if this
might be the cause of my troubles and spurned me to take remedial action

BUT the Saga continues:-

I compiled a little utility program to alter the disc step rate
using the xbios(41,dev,rate) (Floprate(dev,rate) function in Lattice C v_5
and also in MWC). The program also altered the int at addres 0x440 (the
seekrate) for good measure (I believe the older TOSes use this to
alter the rate on both A:\ and B:\ (if present) simultaneously whereas the
newer TOSes (that understand xbios(41,..)) can set the rate on these drives
independently.

The program undoubtedly changed the disk rate BUT the problem (i.e.
the "grating" sound remains). Incidentally, on BOOT-UP my TOS 2.06 comes
up with a default seek-rate of 3ms!! and NOT the 6ms I was quoted by the three
people who responded to me!! Anyway I played about with ALL possible disk
access rates (2ms , 3ms, 6ms, and 12ms) and the grating remains. It is at
its loudest when a file that is being written to floppy is CLOSED or OPENED
and sometimes when directory contents are read. In the "middle" stage of
copying a long contiguous file the grating is not there - which is why I am
(now) sceptical that it is a seekrate problem.

Of course, Charles F. Johnson (Codehead) 's TEC may do a genuine patch to whatever the basic difficulty is. It seems very likely that TOS 2.06's floppy routine were meant for the HD Floppy driver chip and work rather unsatisfactorily with the old STE driver chip. I must get in touch with Codehead (anyone know their Telephone No.?) or accept defeat and reinstall my old TOS 1.60.

STILL bewitched, bothered & bewildered, W. Alan B. Evans
[wabe@ukc.ac.uk]

P.S. In case some of you are wondering - My TOS 2.06 were purchased from "Analogic" at the Wembley show about a fortnight ago and had been stamped as "Made by Compo".

>Serve Sozobon C!? (As the ones I have are quite old, but it's quite
>a nice program to use....)
Beware!
It's not OK, it's very difficult!
Some problems you may get:

1. Same functions in the libarys of Sozobon C & Lazer-C may typed
different (Ok not the standard functions, but the are such funcs)

2. Function existing in Lazer-C, but not in Sozobon C and vice versa

3. Different #defines in Lazer-C & Sozobon C (eg. Soz. defines SOZOBON
and Lazer defines LAZER (that one is simple), "functions" in Sozobon
are defined per #define in Lazer-C and behave different in conjunction
with libary functions that expect #define defined functions....)

And so on and on and on......

Opps!! Never mind. I think I found my answer. I guess that some
of the AES functions are named slightly different between the aesfast
lib and the ABACUS Gem programmers reference. Oh well.

1330. Mouse Warping

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-10 16:20:13 UTC
From: dbshapco@bcars6a0.UUCP
Message-ID: <1993Mar10.162013.6755@bnr.ca>
Source record: 40085

I want to warp the mouse cursor from the top left corner of a box that is being dragged to the bottom left. I thought appl_tplay would be the way to do it but the reference I have could be described as somewhat ambiguous. The bits of code I've made up based on my interpretation of the reference have only resulted in bombs. I have supposedly the codes for making the 6-byte event, but the ambiguous part in the reference is where these codes are to appear in the array passed to appl_tplay. (If I wasn't stuck back on TOS 1.0, I suppose I could use appl_trecord to do this, but appl_trecord doesn't work on that TOS version, does it?)

Help on this or any other technique for mouse warping would be welcomed.

Cheers,

Brad

>a nice program to use....)

I would say offhand, no, you can't do that. In fact, you can't even use,
for example, the HSC v1.33 headers files with HSC v1.40.

There are probably a few header files you could move between compilers
without any problems. OSBIND.H might be okay between Laser and HSC. But
things like CTYPE.H and STDIO.H will almost certainly fail if used with a
different compiler/library/version than what they were defined for.

From: wabe@ukc.ac.uk
Message-ID: <3352@eagle.ukc.ac.uk>
Source record: 40086

In the books I own at least, the approved method of forcing a Media Change is not spelt out. For example the Lattice C_v5 Manual will tell you nothing about how their _mediach() function is actually programmed. Ah well, I guess these people must have their little secrets.

Anyway, purely by chance, I noticed recently that if I simply enter the Supervisor mode and then exit (without actually doing anything) then DRIVE A:\ at least behaves as if a Force_Media_Change call had been done on it. I was using TOS 1.2 at the time and have not checked if this works with other TOSes. If so, then this deserves to be more widely known.

Cheers, W. Alan B. Evans
[wabe@ukc.ac.uk]

P.S. What could be simpler than?

```
#include <osbind.h>
main()
{ long lo; lo=Super(0L); Super(lo); Pterm0(); }
```

What you want is a little utility called Ghost. It's available on UMICH's atari.archive or one of it's mirrors I think, and it allows you to format a special kind of disk that is accepted on a REAL Mac with 1.44 drive (not sure about 800k ones - don't bother with 400k's ...) and is readable by your atari. i think it works with spectre 128, I know it works with Spectre v3.0 (GCR not needed), but if it doesn't, you can convert the disk to Spectre, Aladin and Back to this weird ghost format.

Happy MacIng!

There was a message in Fidonet a couple of weeks back about the ST Club
producing a source level debugger for Lattice C. It also stated that Hisoft are
working on one as well. The guy who posted the message seems to have used
the ST club product and was quite well impressed.

1338. Help needed with a floptical setup

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-10 23:56:52 UTC
From: esj@harvee.billerica.ma.us
Message-ID: <H.eg.Gmn1areLIGg@harvee.billerica.ma.us>
Source record: 39951

I finally decided to get a floptical drive and I need your advice. I think what did it was my HD dying in a way that looked like my HD died. The thought of 100+ meg of backups to floppies is truly horrifying. I've done it once.

My setup is:
Mega ST2
original ICD host adapter
adaptec 4070 controller
60M miniscribe
80M quantum (with another 50 lurking in the wings)

I need
a box that can hold 1 5.25" and 3-4 3.5" format drives
floptical
powersupply for above
software for above.

suggestions?? Can I use my ICD host adaptor or do I need a new one? what sw should I get? I'll be adding up the power budget this weekend and I'll be haunting some of the DIY clone stores for cases and power supplies.

Thanks in advance for any help!

I'll have to agree with Ian, there should be enviroment variables at the desktop, and maybe redirection. Eviroment varibles are a bit more important since anyone using redirection will likely be using a shell anyway. Hopefully that and automatic limiting of certain files! I want to be able to click on any .LZH file and have the desktop load up LZH.TTP, restrict its memory to whatever size I have set (maybe in the desktop.inf file) and have it running in the TOS window manager (MW, TOSWIN, MINWIN, whatever is running). If the desktop could also redirect things and set automatic priorities (so that LZH will run in say, -10 priority, while something else runs at some other niceness and other abilities).

Also, I think there is a need to a new shell. ATARI users really haven't been talking advantage of shells and automating processes with scripts. We need a shell that will do all of the above plus everything a shell normally does. In other words I wanna be able to type LZH and a filename and have a new window open up automatically limited and niced to what I have set for LZH.TTP and hav it executing lharc!

Also, such a shell should support _shell_p too. Any programs could be automated and expended just by having a good shell running. Your GEM program could then just pass the name of a batch file through _shell_p. How about Rexx for a script language.

So, who wants to write this shell for us? I'd love to see it running!

Thanks, Evan Langlois

1340. Re: GEM Execution Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-11 02:57:21 UTC

] That's odd. Seeing as atari Oz' top bods have been wandering around NZ
] talking to quite a few people of late...

Where'd you get that info' from!? There is *sort of* an Atari NZ,
but I'd be surprised if Atari bothers sending any Falcons to this
country, as with the HUGE shipping costs, the low-end machine will
end up being about $1000US over here I'd imagine! (1meg No HD).

Shipping, Tax, Retailer+Wholesaler markups etc. (Maybe not as much
as $1000, but still enough to make it hardly worth the bother)

I'd still like to get my hands on one, but it's beyond my budget as
it is, so there's that problem fixed 8-)
(I can't even afford some wheels...)

1341. Re: Falcon serial

Newsgroup: comp.sys.atari.st.tech

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1nma25INN6ue@golem.wcc.govt.nz>
Source record: 39945

] The good news is that the SCC runs in "x16" clock mode, i.e. the
] serial port can go 16 times faster. So in _theory_ using x1 division
] mode the top speed _could_ be 1,996,800 baud, that's 1.9968 Mbaud.

The average phone-line would make a mess of 100,000 baud! (Copper cables)
I'm not sure what sort of top speed fibre-optics can handle, but
over 1million baud would overload the computer! You could use the
RS232 as a null-cable to network, that speed is quite respectable 8-)

(Wouldn't overload, but it would have to be a FAST computer to transfer
data at that speed, the Falcon would say no-way!)

> be a good deal more work.

Hallelujah! It's been a long time coming. Programming with a 7 character identifier limit has been troublesome to me for quite awhile.

> I have this gut-level feeling that 21 chars is good enough. But I
> figured before I cast it in stone, I should solicit opinions. Bear in
> mind that if the overwhelming sentiment is for more than 21 chars, it's

My opinion: 21 characters is fine. An identifier which takes up 1/4 of my 80 characters screen is too long for me.

Please document it. I guess that means that szadb 2.0 (the free machine debugger which works with Sozobon C v2.0) won't work. Oh well, I never used it much anyway. Will LD still be able to link in the old Sozobon C format?

well, that's better than nothing. Although it's only an interpreter
and it doesn't know about inheritance (bad luck for an object-oriented
language)

Anyway, I haven't done anything like that so... I'm not allowed to
complain !!

I just think it would be nicer if it really was PD (it is shareware),
with source code available !

1344. A GCC (gnumake) question - recursive make calls?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-11 05:00:24 UTC
From: mgm@world.std.com
Message-ID: <C3pKKq.Br0@world.std.com>
Source record: 39947

I'm going to be embarking upon a major project in GCC in the near future, and have a question: Does the ST version of GCC's make utility support recursive calls to make, or is this something that can only happen in the UNIX versions?

Generally, also, how compatible is the ST gnumake with the UNIX variety?

Any info is appreciated. E-mail ppreferred - <mgm@world.std.com>

1345. Help: SCSI Drive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-11 05:21:40 UTC
From: dunham@src.honeywell.com
Message-ID: <1993Mar11.052140.7797@src.honeywell.com>
Source record: 39948

I have a Supra 30 Meg HD, upgraded to 60 Megs with a Seagate ST177N SCSI, running on an STE. But I am unable to make a 1.2 Gb Fujitsu SCSI HD respond that is daisy chained off the Supra on SCSI "1" (except that the light blinks when attempting to access the drive. The drive has yet to be formatted for the Atari, but since it isn't recognized, that's rather hard to do! I have tried every combination of termination, and terminator power to no avail. Finally giving up on the SCSI connection, I replaced my Seagate with the Fujitsu, directly off the Supra controller, but it still isn't recognized as a valid device. It has been verified on an IBM, formatted as a single 1.2 Gb partition so I'm confident that the drive is OK.

Is it possible that the conntroller in the Supra cannot handle this drive? Or is my Seagate fussy about sharing the buss?

And finally, the reason I bought it was for digital Hard Disk recording with the forthcoming Falcon - would I have better luck waiting to format this on the Falcon's SCSI-2 port? (the drive can work on either standard)

Thanx, Scott

Yep, I found that quite irritating in AHDI/HDX V5.0 that if it thinks
it knows the drive it WILL NOT even look at the WINCAP file for its
parameters... it just goes and blindly trashes the drive format when
it makes a mistake doing that and won't let you correct it.
>
>I tried to partition the HD without formatting first, but I got the error:
>
>DRIVE FORMATTED WITH OLD VERSION OF HDX, REFORMAT BEFORE PARTITIONING
>
>Blimmin' great !!

You just can't trust Atari's HDX. Even the older versions don't seem to
accept some WINCAP settings, although they pretend to be formatting drives
that Atari didn't know about at the time they are often actually
just scrambling the format.
>
>Can anyone send me a copy of the 1986 distribution of HDX that WORKS ??
I could send you a HDX V3.2 that came with my STacy, it seems to do my
old SH204 and MEGAFILE 30 ok.

However I would recomend switching to Supra or ICD or something else that
actually will accept your "suggestions" as to the type of drive. Atari
can't really be trusted for alot of mechanisms!

A few months ago I bought an upgraded MEGAFILE 30 with a non-Atari
65 meg mechanism installed. HDX 5.0 completely trashed the format when
I tried it (without even asking me the drive type!). HDX 3.2 asked for
the drive type and accepted the WINCAP entry for the drive mechanism
that I edited, but messed up the 4th 16meg partition. Supra formatted
and partitioned it with no problems at all.

While I am still using AHDI 3.2 for my bootstrap, I will probably eventually
switch the whole system to using Supra...

>
>Can anyone (ie at ATARI) tell me how I can make an ATARI HARD DRIVE compatible
>with an ATARI ST ?? (the program told me to contact ATARI !!)
I don't think Atari knows how to handle hard disks correctly!

Tim> I could send you a HDX V3.2 that came with my STacy, it seems to do my
Tim> old SH204 and MEGAFILE 30 ok.

And I even have the unnumbered 1986 version of HDX, but are you *sure*
that you want it?

Anyhow, to both of you, Tim and Dave, if you happen to have gotten HDX
5.0 off the net, then you will surely notice that *all* the entries in
the WINCAP file are commented out! Yes that's right! So, in the case
that it does *not* recognize the drive, which is what will happen with
an SH 204, it will just start formatting with whatever default
parameters the program uses.

I have a second disk connected similarly to the Atari SH 204, and I
ran into all the above problems. Once I uncommented the WINCAP lines,
HDX proposed all the different configurations inside WINCAP. From
there it was *smooth* sailing.

Normally, HDX 5.0 does not use WINCAP only if it detects a true SCSI
drive.

Hope this helps.

Using the GEM AES Scrap Library, TAKE TWO
By Mike Fulton, Atari Computer

The GEM AES Scrap Library provides a standard method of allowing data interchange between applications via a clipboard mechanism. At the user's request, the current application will place data from its own document onto the clipboard. Later, from the same application or a completely different one, when the user requests the data from the clipboard, it can be read back into the current document. There are two GEM AES scrap library functions, scrp_read() and scrp_write().

The Clipboard Manager XCONTROL panel module allows the user to set the system's clipboard folder to whatever they want, so that this folder will be specified when the system is booted. The Clipboard Manager CPX is documented separately from this article.

Writing a Clipboard Item

WORD sc_wreturn = scrp_write(sc_wpscrap);

The scrp_write() call establishes the directory used to contain clipboard scrap files. A normal sequence of events for an application to put something in the clipboard would be:

1) Do a scrp_read() call to determine the location of the system's clipboard folder. If no existing clipboard folder exists, then it is recommended that your application create a folder named "CLIPBRD" in the root directory of the system's boot drive, and then construct a string containing this path specification.

As far as determining the system's boot drive is concerned, if the system drive map returned by the BIOS call Drvmap() indicates that drive C is available, then you should create the "CLIPBRD" folder on that drive. Otherwise, create the folder on drive A or ask the user where to put it.

2) Do not make assumptions about the format of the string you get from scrp_read(). Always examine the string and insure that you have a valid path specification like "C:\CLIPBRD\", without a file name at the end, and ending with a backslash. Do whatever manipulations are required to get the string into that format. For example, if there is a file specification at the end of the string like "C:\CLIPBRD\SCRAP.TXT", then find the first character following the last backslash in the string and change it to a NULL. If you get a string like "C:\CLIPBRD" without a trailing backslash, then do an Fsfirst() call to check if "CLIPBRD" is a subdirectory, and then append the backslash to the end.

3) An application should delete any existing scrap files in the clipboard directory before writing its own. This is done in order to prevent any possibility of an old scrap file being grabbed by the next application. A application may create its own scrp_clear() function for this purpose. A basic example of such a function might be:

```
void
scrp_clear( scrappath )
char *scrappath;
{
short err;
char scrapfile[200], delfile[200];
DTABUFFER *theDTA;

theDTA = (DTABUFFER *)Fgetdta();

strcpy( scrapfile, scrappath );
strcat( scrapfile, "SCRAP.*" );

err = Fsfirst( scrapfile, 2 );
while( ! err )
{
strcpy( delfile, scrappath );
strcat( delfile, theDTA->filename );
Fdelete( delfile );
err = Fsnext();
}
}
```

The DTABUFFER structure, or something similar, should be defined in one of your C compiler's include files. If you cannot find it, the definition is given below:

```
typedef struct dtabuf{
char reserved[21];
char attribute;
short time;
short date;
long filesize;
char filename[14];
} DTABUFFER;
```

This function would be passed a pointer to a string which contains the current clipboard folder specification, as specified and determined in steps 1 & 2 above.

4) Create and write your clipboard file, using at least one of the standard file formats given below. Clipboard files should be of the form "SCRAP.*" where the filename extension specifies the type of data contained within the file.

The following filenames are reserved for the following file formats. Additional file formats may be added to the list as they appear.

SCRAP.TXT -- ASCII only text, with a CR/LF at the end of each line

SCRAP.ASC -- ASCII only text, with a CR/LF at the end of each paragraph

SCRAP.RTF -- ASCII only text with formatting specified through the Rich Text Format defined by Microsoft

SCRAP.1WP -- First Word Plus formatted text

SCRAP.WP --- Word Perfect formatted text

SCRAP.GEM -- Standard GEM Metafile Graphics Image

SCRAP.IMG -- Standard GEM Bitmapped Graphics Image

SCRAP.TIF -- Tiff (Tagged Interchange File Format) Graphics Image

SCRAP.IFF -- Interchange File Format (Usually bit-image graphics, but not limited to that. Locate IFF file format documentation.)

SCRAP.EPS -- Encapsulated Postscript File

SCRAP.CVG -- Calamus Vector Graphic

SCRAP.DIF -- Data Interchange Format - Spreadsheet/Database data

These are not the only types of clipboard files that may be written. It is expected that many applications will want to write their own specific file format. In this case, it is hoped that the details of the file format are made available so that it can be supported by other applications. In any case, please notify Atari regarding the file format(s) and filename extension(s) used by your application.

At a bare minimum, a text-oriented program should always write SCRAP.TXT. A vector graphics-oriented program should always write SCRAP.GEM. And a bitmapped graphics-oriented program should always write SCRAP.IMG. However, where possible, your application should write as many formats as it can.

For example, let's say you have a word processor named WRITEIT that wants to create SCRAP.WIT clipboard files containing formatted text in its own format. Besides writing the SCRAP.WIT file for its own format, it might also write SCRAP.TXT, SCRAP.ASC, SCRAP.RTF, SCRAP.1WP and any other text formats that it understands. It may even write clipboard files in formats it knows how to write, but which it doesn't know how

to read.

Likewise, a graphics program would write clipboard files for all of the graphics formats that it understands. A vector graphics program might even write out a bitmapped image for a non-vector graphics program to read.

In some cases, depending on the context, it may be appropriate to write both text and graphics formats. For example, if you are in a graphics program and the user has selected a text object to copy to the clipboard, then the application may want to write a SCRAP.TXT file containing the text from that text object. Or if the user is currently editing a text object, and chooses to paste from the clipboard, then it would be valid for the graphics program to look for a text clipboard file so that it can grab text to put into the text object.

5) If you got a valid clipboard directory from scrp_read() in step 1 and no manipulations were necessary in step 2 in order to get the string into the correct format, then you are done.

6) If you did not get a directory from scrp_read() and so created the "CLIPBRD" folder yourself, or if you had to manipulate the string in step 2, then you now need to do a scrp_write() call using the string obtained at the end of step 2.

Reading A Clipboard Item

```
WORD sc_rreturn = scrp_read( sc_rpscrap );
```

The scrp_read() function returns a string containing the clipboard directory specification. The sequence of events for an application to read an item from the clipboard would be:

1) Do a scrp_read() call to get the clipboard directory. If scrp_read() returns zero, then the clipboard folder has not been set since the computer was last reset. If the return value is non-zero, then the clipboard directory specification is returned to you.

Do not skip step 1 because you've already done it once. All steps must be done each time you want to grab something off the clipboard. Do not assume the clipboard directory will not change while your application is running.

The scrp_read() function is defined as possibly returning an error code of zero. However, this function currently always returns a value of 1. Since this may change in future versions of GEM AES, applications should handle the case of the error code even if the programmer does not expect to see it.

2) If scrp_read() returns an error code of zero, then the application should act as though nothing is available on the clipboard.

3) If you get a valid string from scrp_read() then you need to make sure it is in the correct format as described above in Step 2 of "Writing a Clipboard Item".

4) Now you should have a path specification like "C:\CLIPBRD\". Now use Fsfirst() and Fsnext() to search the clipboard directory for a "SCRAP.xxx" file your application understands. You should first look for the formats that will provide the most information and then check for more simple formats. That is, a word processor would want to look for SCRAP.1WP before looking for SCRAP.TXT, because the SCRAP.1WP file would specify information about formatting and text styles that the SCRAP.TXT file would not.

5) Assuming your application can find a scrap file that it can understand, then it should open the scrap file, read in the information it contains, insert the information in the the current document as appropriate, and then close the scrap file.

> any real work done on these machines.)

Because Atari hasn't done anything to improve their machines. It takes
the external unix-heads to fix things (or we still wouldn't have a
multitasking GUI).

>program which can do this? Many thanks.

That's not possible. Only BIOS since TOS 2.?? sets a Bit in BPB when found a media with only one FAT.
But this Bit is - of cource - ignored by GEMDOS.
Gemdos only uses the second FAT when reading, the first FAT is not read but updated when the second was changed.

Eric, I don't own a floptical drive so I won't hazard a guess to answering your questions, but here are two places that deal with flopticals with the Atari and they should be able to help you out:

Toad Computers, 800-448-8623 or 410-544-6943
Purple Mountain Computers, 206-747-1519

_____ John "HUTCH" Hutchinson _____

1354. GFA BASIC Toolkit, Vol II

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-11 17:20:53 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1993Mar11.172053.26774@newshost.lanl.gov>
Source record: 39957

WANTED: Your routines, procedures, functions and GFA utility programs for inclusion in the upcoming 'GFA BASIC Toolkit, Vol II.' This will be a book/disk consisting of routines which the average GFA BASIC user can merge with his/her own program to carry out specific tasks.

As in Vol I (published by Taylor Ridge Books, 203-643-9673), all the routines will remain in the public domain for easy accessability. As Vol I was directed primarily at the beginner, I am looking for a bit more depth for Vol II to support the intermediate level GFA user. In addition to your procedures and functions, short, single-purpose executable utility programs are also invited as well as hints & tips.

All those whose contributions are selected will receive a free copy of the book/disk when published, full credit for their work, and the endless gratitude and respect of GFA BASIC users worldwide. :)

Guidelines for contributions:

1) All contributions must be of your OWN work and be PUBLIC DOMAIN. If it is NOT your own work, go ahead and send it anyway if you are sure it is public domain and know WHO the original author was.

2) "Short and Simple" routines, procedures, and functions are most desired. Have you developed a "short cut" for which there is no standard GFA command? Do you have a favorite tool or utility which you use to reduce programming time/chores? If so, let's see it.

3) All contributions must include full source code (obviously) and be provided in ASCII .LST format. Short routines may be sent via email or GEmail. Long listings should be sent via GEnie Fmail or via postal 'snail-mail.' Do NOT send routines/programs via UUCP!

4) All contributions should be heavily documented via comments in the code and/or another file. As a minimum, comments should explain:

a) Purpose of the code (what it does), in brief.
b) Initialization requirements (if any).
c) Parameter usage (if any).
d) An example call of the routine.
e) Compatability with previous GFA versions (if known).
f) Compatability with various TOS versions (if known).
g) Video mode (i.e., color or monochrome).
h) Remarks, hints, tips for proper usage.

5) If you own Vol I of The Toolkit (and if not, why not?), following the format presented there will make my job as editor/ compiler much easier and nearly guarantee you a place in the book. :)

Without your contributions, Vol II will not come about so just do it!
Any questions, contact me via email, GEmail, or phone at 505-662-7236.

(with apologies to non-GFA users for taking up "their" bandwidth) :)

>the symbol file alright, it accepts a breakpoint on main, but when I
>type `run' it stops with a `signal 0 received in _start'.
This is on purpose - even if this is a hack. An information about
the program will be "relocated" in this moment and only after THAT
you may set up breakpoints and in generally access program memory.
Remember that original gdb is designed for a system with a virtual
memory and not for ST.

> If I try to
>`cont' it says `bus error reading to or from child memory'.
Your breakpoint was set somewhere - who knows where. Maybe on
an odd address or sytem ROMs?

>Is it me, my libs, my gcc or mint, that is the problem?
Yeah, this is the question!

gdb reads, if available, a startup file .gdbinit with commands.
If you have 8+3 file names then .gdb works equally well. It is
a good idea to create .gdb files with a contents like this:

```
exec test.ttp
sym test.sym
set-args 1 2 34 "hello"
run
# gdb breaks automatically here with 'signal 0'
b main
com 1
printf "here we are at main, %d\n", argc
end
# <other commands we want to set up here>
continue
```

With such file it is enough to start gdb, without any arguments
but from the right directory, and things will happen.
Now, come to think of it I am not sure at the moment if 'set-args'
should be before or after initial "run". Check it out.

>> [HSC 2.0 will allow longer external names]
> document the symbol format

I am in the process of being convinced to use GST format symbols so that HSC 2.0 will be compatible with szadb and other tools. I'm trying to learn about GST format symbols now. I'm also near-convined that some things JAS and LD are doing with symbol flags are wrong, but I'm having a hard time confirming that via comparison with other tools. (EG, the DEFINED bit is set in a symbol even when the symbol is referenced from a module but not defined in that module; that seems pretty wrong.)

Also, I ran into a bit of a problem in preparing the 2.0 release. I had forgotten that the GemFast low-level bindings are written in madmac assembler, and rely on a lot of madmac features that jas doesn't have. So, I'm having to do a massive conversion of gemfast source code. ::sigh:: (I damn-near started hacking macro handling into JAS as a possibly shorter project than converting the gemfast code. ::grin:: But then I wrote some rexx scripts to do the bulk of the gemfast conversion for me.)

```
>> a program that forces TOS to use the backup FAT
> that's not possible

Sure it's possible, on any TOS version. You just need a little TSR that
sits in the Rwabs() vector, and watches for reads from sectors containing the
primary FAT. When it sees such an access it changes the sector number in
the call parms to the corresponding sector of the backup FAT, then passes
control through to the next Rwabs() handler in the chain.

It's the kind of thing I could sling together in about a half hour by
modifying existing Rwabs-hook/driver/cacher code I have laying around on
disk. But, to package it as a ready-to-use user-friendly system would be
a matter of days rather than hours.

>
> Larry Richardson

GemFast supports all documented AES calls. (Not including any
MiNT/MultiTOS-specific calls Atari may have added in the past few months).
There are still some documented VDI calls it doesn't support.

For the menu function you want, menu_ienable() is the name. Yes, spelling
counts in programming, in spite of the fact that spelling is (by all
appearances) not a forte amongst programmers in general.

Hm, all the Macs and NeXT machines I've seen use DB25 (SCSI-1) connectors.
Old Sun workstations used DB50, current ones use SCSI-2 connectors, which
are actually standardized. If you ask for a cable with a "SCSI-2" connector
on one end, it will be correct. (Of course, you still have a variety of
choices for what goes on the other end...)

1363. Monochrome composite monitor on Falcon?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-12 02:20:18 UTC
From: jjmcwill@mtu.edu
Message-ID: <1993Mar12.022018.10825@mtu.edu>
Source record: 39968

Okay, I got a question:

I've got a goldstar greenscreen monochrome composite input monitor.

It has a Horizontal Frequency of 15.699kHz, and a Freq. Band Width
of 18mHz. It's a 12 inch monitor.

The $60,000 question:

If I were to purchase a Falcon030, how usable would this monitor be
as my main monitor on the Falcon? What resolutions would I see?
Would I need any special adaptors?

Any help appreciated, either via follow-up post, or by e-mail

Hi, I seem to have a problem compiling the file context.s which is made from context.spp in the mint 0.99 source. I'm trying to compile it on a 4M ST using the shareable versions of GCC 2.33p1 and gas 1.38. My libraries are at pl30. The assemble seems to be choking on about 7 lines with the pmove operator. I checked a mc68000 reference guide and found that there is no pmove operator. If anyone has any suggestions to solve this problem it would be greatly appreciated. Thanks.

This is because these instructions are '030 instructions. Either remove them
(they won't be called on a 68000 anayway), or update your copy of gas.

>Hmm, maybe I should have added that I know about the -pipe option. However,
>that doesn't work on the GCC I got (2.3.3 PL1 from a.a.u.e). Any hints?

I don't recall from your original message whether you said you were running under MiNT or TOS. You definitely won't be able to use "gcc -pipe" under TOS.

Second, I don't know if the TOS library supports MiNT pipes. So "gcc -pipe" may not work under MiNT either, unless the GCC you are using (and all the subprograms, gcc-as, gcc-ld) were compiled with the MiNT library.

Now here's the tricky part...Many programs (including gcc-cc1) use all of the ST's remaining memory after loading for their stack. This means you can not run any new programs while one of these programs is in memory, since it will not have enough memory to run in. You may be able to alter this behavior by using the "fixstk" program from the gcc-utilities package (utlbin33). Youll have to experiment to find the maximum value for the stacksize that will still let you run new programs (don't use a value that's too small or gcc-cc1 won't work at all.)

good luck,
entropy

Of course it's possible. Write a TSR that hooks into the hdv_rw vector.
The TSR would then deroute accesses to sectors in the first FAT to
the second FAT.

I don't know offhand about the adaptor. But you will need recent
software. ICDBoot 6.02 works but doesn't let you partition the
floptical drive. ICDBoot 6.03 does *not* work! ICDBoot Pro permits
both formatting and partitioning.

All this depends on who you have on the phone or what store you go to!
The DB50 standard is also known as SCSI-2 in some stores! And the new
"SCSI-2" can be called "micro SCSI-2".

Your mieage may vary.

1374. HD problems with SST

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-12 13:33:36 UTC
From: lahtinen@gideon.fmi.fi
Message-ID: <lahtinen.731943216@gideon>
Source record: 39977

I have SST running at 33 MHz and ICD Advatage adapter and some big
problems. I have two hard disks and the ICD tape. The problem is
HD errors, very often I can not read something from the drive
(like cpx-files) and the it halts if I try to select accessory
(you can not see anything under the desktop menu item).

A friend of mine suggested that there could be some funny echoes
in the DMA cable, but at least changing the cable did not help.
The SCSI cable is quite long but a shorter one did not help.

I am planning to make similar buffers than there is in the TT,
but I do know if it helps. I think it is now wise to put
220/330 ohm terminators in DMA cable, the DMA chip might dislike it.

Any help would be fine as I can not get in touch with GBS.

} : (system-4MegF030+65MegHD)
}
} I have had the same problem. But you can use xcontrol and mfs055 together
} with MiNT0.99. This will work on my ATARI!

I hate it when this happens - mfs 0.55, xcontrol, and MiNT (0.91 and upwards) have always worked fine for me. I'm now working with 0.99 and that seesm to be fine. Try removing bios buffering in the mint.cnf file (that seems to cause lots of problems). I have noticed that Quick ST 3.0 won't work with MiNT 0.99 though, whereas it used to in earlier versions. It fails before the 'load xfs filesystem' code.

Simon.

Hmmm... I'm running Mint .96, mfs, and xcontrol and usually have no problems. On one or two occasions either Mint or mfs have acted up--it would crash everytime it booted. Copying fresh copies into the Auto folder seemed to solve the problem, but I never did figure out exactly what the problem was, and it hasn't acted up in quite awhile.

There is one now available. Not written by HiSoft though. It is available
from the ST Club (c.f STapplications)

The ST Club
2 Broadway
Nottingham
NG1 1PS

Tel: 0602 410241
Fax: 0602 241515

STapplications is a subscription only mag. It does not appear on the stands.
Best ST mag by far. 18ukp for 12 issues, 26.50ukp for 12issues plus 6 disk mags.
21ukp to Europe, 31ukp to the rest of the world ;-)
The debugger is i think(!) priced at 24.95ukp. Roomered to be very good, i
do not have it yet.

Adam.

> the desktop needs environment variables

Well, there is GEMENV, my program that adds env var support to the gem desktop. It's part of the HSC package, and is also available separately. It works great, except that it doesn't work on TOS 4.0x, because Atari changed the way the desktop works.

Now I have no problem with them changing the way the desktop works in regards to env vars. I suspect the change is just that they're using a different compiler now, one that supports environ[]. If they had added a new AES call to TOS 4.0x to give you access to the desktop's env vars, then everything would be peach, I could do a quick update to gemenv.prg so that it used the new method on TOS 4.0x, and the old method on prior systems. The problem is, Atari didn't provide any access to the desktop's env vars. (Unless you're running multitos -- it has a new call for manipulating env vars. But if Atari thinks that everyone who buys a Falcon will be using multitos, they're dreaming.)

> How about Rexx for a script language.

That's exactly what we need. If anyone knows of PD Rexx source code, I'd be more than happy to attempt a port to the ST. I've been using rexx for about 10 years, and I understand how compilers and interpreters work, but I don't think I could create an ST rexx from scratch.

The source debugger from Megamax, called LaserDB, is excellent IMO. You
can switch between source and assembler, and even debug a low-res program
while the debugger screen runs in medium-res. It's available separately
from Laser C. (Can't remember if you need Laser C-generated files to use
it though).

If you don't mind transatlantic connections you could try nic.funet.fi
in the directory /pub/unix/tools/zip/ (if memory serves me right).

There are NO DOUBTS sites in the US that carries unzip-utilities too,
but I haven't had any reason to look yet. :-)

And if you still can't find a unzip-utility then log into your nearest
Archive-site and search for unzip50 or unzip-5.0 or something like
that.

1384. need help building toswin

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-13 23:07:52 UTC
From: michaelk@titan.ucs.umass.edu
Message-ID: <1ntpg8INN2ao@titan.ucs.umass.edu>
Source record: 39988
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I've been trying to compile the toswin sources on atari.archive,
and while I can get it to work as a .prg, when I rename it to an .acc,
I get a bus error trying to load it, and I have to reboot.
I'm using gcc 2.3.1, gnumake 3.58, gemlib 23, include and library 85,
compiling under tcsh in mint 0.94. When I look at the output from the
make, I get two warnings:

```
In file included from toswin.c:22:
twproto.h:88: warning: type mismatch with previous external decl
g:\\gnu\\include\\minimal.h:66: warning: previous external decl of `main'
```

and

```
event.c: In function `evnt_loop':
event.c:177: warning: type mismatch in implicit declaration for built-in function `strlen'
```

I've removed all of the CFLAGS except -mshort (used to be -mshort
-G -O2 -Wall -fomit-frame-pointer, which would just give me more warnings).
Anybody run into problems with this before? Recommendations?

Thanks for any info,

Michael Kieras
michael@cs.umass.edu

Actually, the Atari code specifically disallows the -pipe option. You would need to modify the source and get rid of a couple #ifndef atarist lines to reactivate the option, and it would only work while running under MiNT.

Probably not worth doing on a 4M ST, but if you have more memory than that available, it becomes meaningful. (The main question is, what would happen if you set _stksize to something that was too small, and some program was unable to get enough space off the stack for an alloca call... alloca tends to get used quite heavily in the GNU software...)

I understand; it's a lot of hassle, especially if appl.B doesn't follow the
XBRA protocol. I think I'll just do it the simple way and call a routine
with Supexec periodically, that's a lot simpler and it will always work.

On the ST that which used to be Turbo C is now called Pure C. I use it a
lot and I think it is very good.

JA> Does it have a source level debugger, if so is it any good?

It has indeed and it is very good. Not only is it a source level debugger
you can also go quite deep with it and look at the CPU registers and the
assembly code generated by the compiler (very interesting!) unlike Think
C's source level debugger on the Macintosh.

I still use the Laser C environment on my ST. I find it fast (both in terms of compiling/linking and the speed of the resulting code). Also the source level debugger is really good - mixed C/assembler can also be handled, you can set up watch windows for variables, set breakpoints etc etc. ANd the code seems to have few bugs - something I could not say for Lattice, which I had to give up on.

But I haven't seen it advertised for a while now, so perhaps it no longer exists?

Keith.

Hi there,
I've been working on a new window operating system for the ST computers
for 2 years now (not man years!) ... because it needs a better one.

Well anyway I've managed to build a complete set of widgets, over-laying
windows, a virtual desktop, etc .... and it's wicked!

I've already written programs with this system (a multi-function disk-analyser,
a natural language preprocessor, etc) .... BUT what I really want to do is
multi-process programs in my windows ...

I've tried using the MFP chip, but no luck; I tried time slicing each process
and it just crashed after switching once for some weird reason; I had saved
the PC and SR.

This is really giving a BIG headache .... can anyone help???

I could send some demos of the work I've done so far if anyone is interested.

Ahem....yes, there is: atari.archive.umich.edu /Archivers/Unix/unzip50.. :-)

gunzip also claim to be able to unzip files (why isn't gzip ported to ST yet ?)
gunzip, like any other GNU utility is available at ..
prep.ai.mit.edu: /packages/gnu/gzip-1.xxx (I believe)
(and many other places)

>Alternatively, anyone know of a good C with source level debugger?
>(Lattice is useless)
Why so? Lattice 5.52 is IMHO a very good development system. It has
also been Falcon compatible for over 6 months now.

A fully programable source level debugger is now available for it,
written by Andy Pennel (who wrote Devpac & much more). Called X-Debug,
It costs GBP25 and supports single stepping, local variable access when
working with high level languages. It supports Hisoft Basic, Devpac 3
& Lattice C. It has a script language that alows complex sequences
to be built up as well as a full expression evaluator, aliases and procs
with parameters. A cutomisable interface is also included.

I don't want to start any blasphemous rumours,
But I think that God's got a sick sense of humour - ML Gore

1394. SM124 problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-14 20:36:25 UTC
From: ehood@hydra.acs.uci.edu
Message-ID: <2BA39749.6556@news.service.uci.edu>
Source record: 39997

Problem:

After a harddisk write, the image on my SM124 will turn to a bunch of squiggle lines (like the vert/horz setting gets all wacked). This doesn't happen an every disk write. Sometimes it takes several writes to disk (the write count is not constant) before the screen wacks out. I also have a SC1224, but it never showed the problem. If any of you have susggestions on what could be causing it, please drop me note.

My system configuration:

Hardware:
Mega ST2 w/Tos 1.2
80Mb SCSI Harddisk w/ICD Host Adapter
SM124 & SC1224 monitors w/Monitor Master
V.32 9600 external UDS Motorola modem
Golden Image Mouse

Software:
Neodesk 3.0x
(The screen wack-out has occured in any software when I was saving a file to disk: Word Writer, Pagestream).

I do not know if it is a virus since the bahavior occured after the end of last summer where I had no contact with external software for over 3 months (unless it is a dorment virus). I do not have any good virus programs for checking the harddisk, so if any can tell me where one is, I'd be greatful.

Please respond via e-mail, Thank you.

Ahh ha! I rember what the problem here is. If I remember correctly the
major problem with Supra controllers (one of the reasons they really
don't exist anymore) was that they only have the capablitlity of controlling
one SCSI device!

Unless my memory is failing me I belive that's what the problem is.
I also don't think that the Supra can handle a drive as large as 1.2 Gig.

Hope that helps!

>PC's controller?

I think you can not read the drive in PC the main problem is perhaps the
different partition information. But you could read the pc-drive in Atari,
at least with new ICD drivers. I have not yet tested it, but they
promice it in the documentation.

But anyway you can test the drive with a SCSI controller in pc, but
I am afraid you lose all your files.

The ST-Club's X-Debug is apparently written by the same chappy that did
MonST (and therefore the Lattice) debugger. I ordered it as soon as it was
advertised, but haven't received it yet; must chase them up today.

I did think about waiting for a review of X-debug before ordering, but
the only UK ST mag capable of reviewing it now is ST Applications, and
they (funnily enough) always give rave reviews to ST-Club products...

1400. Window sys - Multproc article - Info

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-15 09:55:24 UTC
From: esuoc@csv.warwick.ac.uk
Message-ID: <1o1jqcINN6am@violet.csv.warwick.ac.uk>
Source record: 40004

Hello,
I've been asked about my window system...well I've posted a couple
of GFA BASIC 3 mock up programs to comp.binaries.atari.st.

I've used GFA BASIC to do all my mock ups, ideas on how to implement
such a system...I've written another version of the same system in
C/Assembly and it's even faster!!

There are two .GFA TEST programs ...
o Diskanal.gfa - is a half completed disk analyser
I'll probably finish it off when I've finished
the new window system ; which shouldn't be
long! The Bootsector, Directory editors do work
and some other little stuff......
Play around with it! But be careful!!!
(If you mess up your disks, don't blame me!!)
o Virtual.gfa - demonstrates a large virtual dektop
it doesn't use extra memeory for it's 9 screens!
NOTE: to get to another window just move the
mouse pointer to the edge of the screen.
Very similar to Xwindow's vtwm.

Well these programs are very very old (6 months old) ... The new version
is much better graphically and much faster!; it now has a on-line
hypertext system, icons, sound etc....and it's less that 60k long so
far!!

Source record: 40022

Is it possible to connect a standard PC keyboard to an ATARI to replace the existing keyboard? Which ATARI, what the configuration ? (I hear you ask.) Sorry I dont know !!! I am posting this for a friend. If nexessary I could get the details. I'd like to know the following:-

a) Is there is a device that can be bought which permits this,
b) If there is how much and where from,
c) Is there a schematic diagram which shows how to build a connecting device
d) Is there a chipset which is readily available for a connecting device.

If there is a FAQ in which this has already been dealt with, then could someone point me to its location.

I would prefer responses by email because I dont normally read this group.
Thanks in advance.

>throughput, as compared to kermit's fantastic 45%!

With Kermit 5A using 4K packets and 2 windows you can get about the same as
Zmodem, there's no waiting for ack packets and very little comms overhead
either.. I was getting about 950 cps over a 9600 bps line, that's not bad!

This was Kermit 5A (188) (I think) running on both ends, one end being a Sun
SPARCstation and the other being my TT running my port of Kermit 5A (188)
over MiNT 0.99. (My port is full BSD including dialer and curses except for
the connect part (ck?con.c) which is the standard ST version (ckscon.c).)

From: lingnau@math.uni-frankfurt.de
Message-ID: <2315@diane.informatik.uni-frankfurt.de>
Source record: 40008

In article <1993Mar2.220040.7367@newshost.lanl.gov>, hutch@bellman.lanl.gov (John Hutchinson) replies to an earlier posting of mine:

> >Well, I tell users that, when they actually change the resource file, they're
> >on their own when things break, so they had better know what they're doing.
>
> Hahahahaha... Yep, that sounds like a great user support policy to me. :)
> But the trick is to make it as difficult as possible for the user to screw up,
> even if it's the user's fault by not "following the rules."

Oh well. It turns out that I didn't actually have to tell anybody that they're on their own for fiddling with my resource files, yet. [And I didn't hear complaints about my user support policy, either.] So this means that either nobody ever bothers to change the resource file or that the ones who do know their way around. Which suits me fine both ways. As far as I myself am concerned, it's a lot easier to maintain the program, the German and the English user interface separately. I've also had somebody volunteer for doing a Swedish resource set, which is very easy with separate resource files because I don't even have to give out source or fold back weird strings into my own code. So no embedded resources for me.

> Copyright was just an example, and maybe a poor one.

So what other (better) examples are there?

> I _do_ encrypt some
> things, like serial numbers, user registration info, etc, but that's embedded
> in the code itself, not via a resource.

Of course. I suppose if I had to deal with serial numbers and the like, I'd do it the same way. Right now, I guess there *might* be an encrypted copyright notice hidden away somewhere in the executable...

> >Embedded resources suck. Period.
>
> Thank you for the enlightenment... of course, my mileage may differ. :)

Sure. Suit yourself.

1405. Evnt_multi behaviour

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-15 16:04:35 UTC
From: jeroen@cs.ruu.nl
Message-ID: <1993Mar15.160435.7124@cs.ruu.nl>
Source record: 40009

While using the evnt_multi call, I encountered
a weird behaviuor of the mouse. I wonder if
this is a known bug (I'm using TOS 1.0), or
that I am missing some thing. (I hope for
the latter...)

Here is what happens:
Using evnt_multi, in a loop I sollicit for keyboard-input
and mouse-clicks:

```
while(1)
{
evnt_multi( MU_KEYBD | MU_BUTTON , .... );
process_input;
}
```

This works fine for a while, but when the mouse is moved
to the menu-bar (that is still enabled when this code
is executed), afterwards mouse-clicks are not detected
anymore. The same thing happens when the mouse is moved
to the 400th line of the display.

I considered that maybe I should call

```
menu_bar( menu, 0 )
```

first. This helps a little, in that mere moving the
mouse to the menu-line is harmless now. Clicking on the
menu-line however is as fatal as it was before: instead of
reporting a mousclick for this click, all future mouseclicks
are ignored.

The keyboard-events are still being reported. If, in the
process_input part of code, a form-alert is called, afterwards
everything is normal again.

What magical clean-up call is it, that re-enables the
mouseclicks? I am willing to call it before every evnt_multi,
if I must... desperate as I am...

But of course, if I am doing something fundamentally wrong,
I should like to know what that is, too. All help is welcome!

I finally got my Falcon on saturday.
Only to find out that I had also gotten one with one defect
sound channel :(:(:(
This was not a rev.4 machine (which is what is being sold now),
and it seems from previous articles posted here that this is a
recurring problem with pre-rev. 4 Falcons :(

Oh well, I just had to complain in public.
It feels (very little) better now.

1408. Writing to Cartridge Port?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-15 16:51:51 UTC
From: tevans%sunset.cs.utah.edu@cs.utah.edu
Message-ID: <1993Mar15.095151.12573@hellgate.utah.edu>
Source record: 40011

I'm currently taking some hardware classes at the University here and we are required to to design some hardware circuts which need to be simulated. Well, instead of me having to flip toggle switches and push a button for the clock to get my state machines to work, I'd like to write a quick program to send the necessary pulses to a port. That way I can just make some sort of simulation file and send it out and see if my circut works. I would like to use the cartridge port because the parallel and serial ports on my Mega2 ST are already taken.

So, is there somebody that can give me some info on how to write to the cartridge port? You may either post responses or send them to tevans@cs.utah.edu. Any other hints and suggestions are also welcome!

Thanks!

Terry Evans

Writing to the Cartridge port will create a bus error. What has worked in the past is to define one of the bank selects as a write strobe and use 8 of the address lines as pseudo-data out lines. Then by reading an address in the selected bank you are acutally causing your hardware to write.

Make sure you buffer every line that you are using, or you could inadvertantly fry your machine, via a glicth from the target system.

Date: 1993-03-15 19:06:41 UTC
From: sourada@iastate.edu
Message-ID: <sourada.732222401@patty.ecss.iastate.edu>
Source record: 40016

I've been having a problem, and I've either become more aware of it lately
or it has been getting worse.

If I switch disks several times (it is most noticable when I am looking for
something on a disk and check several directories from the desktop), my
machine often bombs and resets while starting to read a new disk. It doesn't
happen just with certain disks or with certain programs. The only thing that
seems to be consistent is that it occurs after a few disk changes.

In case it matters, I use DC Formatter almost exclusively, in 10 sector,
80 track, double sided, skewed mode. I recently (but not very thoroughly)
cleaned my drive, that didn't seem to help. I haven't tried a head cleaning
disk or anything like that. I checked the drive speed, it's about 300 rpm.

If anyone can give me a hint about what's going on here, please do.

Thanks,
Steven Ourada

Does anybody have source code (preferably assembler or GFA) that could
be used to drive 8-bit periferals (sp?) in ST-mode.

Basically, I am looking for source that would allow me to drive an
8-bit printer as though it were a regular printer.

I understand SIO communication structure but I'm not sure how to
communicate with the devices with the XFormer cable. I know it
involves accessing the printer pins individually but I don't
know how to begin doing that!

The other thing is how do I capture the outgoing printer data so
that it goes through my assembler routine first rather than going
to the printer port directly?

Any help would be appreciated! Thanks!

Yes, it's true... but you may find that software pretty complicated :)

The DSP can do realtime Fourier Transformations, and I think they are the
first stage of voice recognition.

Yes! I can confirm this now - the *@#$ Supra cannot handle the 1.2 Gb Fujitsu!
I can get it to work only for a while, then it just dies. I'm not too
concerned though, as I will be hooking it up via SCSI-2 to the Falcon. Thanks,
"Zoooks"!

If you touch the menu bar, does the menu drop down?

If not, you've probably set the wind_update(BEG_UPDATE) semaphore. If you do this, the screen manager blocks when trying to paint the menu, which sometimes results in locking the mouse.

Hope that helps..

From: Trevor.Kirby@newcastle.ac.uk
Message-ID: <C3zBzq.3EJ@newcastle.ac.uk>
Source record: 40032

I recently upgraded my stfm (rev c board) with the compo tos 2.06 board.
Since then I've encountered a few problems.

1) You have to hack chunks out of the shielding to get the keyboard back in.
Before we hacked the chunk out there was no way to get the top back on.
We tried it without the top shielding and got a rather bizzare fault
with write errors on the floppy when either of drive B or the hard drive
were connected.

2) When moving more than one file on the hard disk (seagate with icd controller)
I get frequent write fails followed by a sense error 04 (drive not ready).
The drive works fine on other ST's and a shorter cable does not solve the
problem. Cleanup can find no errors either. Anyone seen this before, is it
liable to be anything other than the DMA chip?

Trev

1429. Forms in GEM windows

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-16 13:41:25 UTC
From: dxo@cs.bham.ac.uk
Message-ID: <1993Mar16.134125@cs.bham.ac.uk>
Source record: 40031

A week or so ago I posted DeskTracker to comp.binaries.atari.st (I think that's the name!)... But I have a question and if it could be answered it would make the program much nicer.

How do you stop a program getting mouse button events when a form is on top of it? The program runs in a window and needs to be passed button clicks so that it can press its buttons in the window.

I'm specifically talking about Harlekin II, since when you bring up its Control Panel thing, DeskTracker used to still get clicks when the mouse button was clicked. Thus my button press routine made the button appear thro' the Harlekin dialog. Not nice!

My fix at the moment is that on receiving a click I wait until the next timer event (which I run at a very high speed) and then respond. The timer does not get through while the aforementioned dialogs are present.

There must be a much nicer way than this! Can someone explain?

Thanks!!!

David.

Some more subsets added to the MiNT Distribution Kit...

(extract from 0readme follows...)

Tue Mar 16 16:02:51 WET 1993
==========

Doc1.zoo:
This is the set of manual pages (both pre-formatted and not) from
Hildo/Eric + all the MiNT docs that come with the original package.

Gcc-as138.zoo:
This is the GNU Assembler version 1.38 patch 4. The latest to date
AFAIK.

btcsh.zoo:
The tcsh shell (my favourite :-) compiled to be shareable, and also
including the slash-switching environment variable (ie: \ -> /).
This is a later version of tcsh - the one in the original kit is
version 6.00.02 and this is version 6.02.

They are available from phlim.ph.kcl.ac.uk as usual, and I will upload them
to a.a.u.e asap.

I hope to compile groff soon so that these manual pages actually work
properly - I've had too many problems with the nroff manual pager system.

ps: (the finger info has been updated too)

Simon.

> How do you stop a program from getting button clicks when another program
> has a dialog open over it?

What you're really asking, I think, is: How do I prevent other programs from misbehaving? Because if they were behaving properly, I don't think you'd be getting button events that belong to them.

One thing that comes to mind is: how are you responding to button clicks? That is, you implied that if the click happens over one of your dialog buttons in your window you're painting the button (changing its select state I assume). Are you doing the painting by sending yourself a redraw message for the selected object, or are you just calling objc_draw() directly? The latter technique may not be such a good idea, unless you've checked that your window is on top, and then done a wind_update(BEG_MCTRL) to prevent any other window from getting topped. And at the very least you should have wind_update(BEG_UPDATE) before you draw your object, and END_UPDATE afterwards.

Source record: 40037

All I can find at a.a in terms of GNU C docs is a formatted man page that describes the compiler command line arguments. I need a bit of deeper info, perhaps someone here can answer a couple questions for me?

- Can you link GST-format and GNU-format object modules together?

- Are parms passed on the stack, in regs, both/either by option, or what?

- Given foo(short a, long b); will it pass a short and a long (ie, six bytes of parms on the stack), or will the short be promoted to an int and get passed as a 32-bit value when sizeof(int)==4?

(In regards to parm passing, I'm only concerned with integral types; I don't need to worry about floating point or structure/union types.)

There is also a quite extensive TeX format doc file, have you checked that out yet?
>
> - Can you link GST-format and GNU-format object modules together?

Currently, no, the linker is a standard Unix a.out format linker with a custom back-end for writing Atari executable files. However, it *can* save GST-format symbol entries in the Atari symbol table.
>
> - Are parms passed on the stack, in regs, both/either by option, or what?

Stack only. There was an option implemented in GCC 1.40 for passing parms in registers, but while it did provide some speedup, the compatibility problems associated with the new calling convention made it too much of a headache to use. The option was dropped in the GCC 2.x ports. (For m68k only. Of course all RISC machines pass parms in registers...)
>
> - Given foo(short a, long b); will it pass a short and a long (ie, six bytes
> of parms on the stack), or will the short be promoted to an int and get
> passed as a 32-bit value when sizeof(int)==4?

That depends on another option. By default GCC will use 4 byte ints, in which case char and short are promoted to 4 bytes; if you compile with "-mshort" you get 2 byte ints instead.

I'm sure you're misremembering, it was the Atari SH2xx host adapters that had this problem. I've used multiple SCSI devices off a Supra host adapter before without any trouble. It sounds more like the two drives mentioned in the prior posting are both trying to supply 5 volts to the TERMPWR line, and one or the other is burning out the other's power bus. This will invite total failure in a very short time, SCSI-2 or no. The trick is to simply notch out that line on the cable (it is either pin 25 or 26, I've forgotten which. I think it must be 25, since all the even lines are grounds.)

Gee, that's a real pity. It drops the probably of the high-level GemFast
code being ported to GCC to near zero. The code won't work well with the
current GCC GEM bindings because GCC's GEM has everything (even elements in
structures) defined as 'int' when 'short' is the proper type. I was
hoping to just drop in my own low-level bindings, but it would be too much
work to try to support wrong-sized args coming in on the stack. And
the existing GCC GEM bindings code is basically too hard to read for me to
have any interest in trying to puzzle out what I'd have to do to fix the
short/int problem and get all the structures defined with the right types.

That leaves GemFast as supported on every ST C compiler except GNU. Why
doesn't that surprise me?

You seem to have a bad attitude, though I can't understand any reason why. A TeX document is a plain ASCII text file. If you don't want to run the thing through TeX, that's fine, you can just read the thing into your favorite text editor. If you think it's too unreadable, with all the TeX commands interspersed, why don't you do everyone a favor and strip it down into a straight text file with no TeX commands, and re-upload it? We can try to be helpful, but there sure isn't much satisfaction in trying to help someone who's only going to complain about something else. Nobody is earning any money from providing this stuff, and we all have real projects that need our attention. If you think there's a deficiency somewhere, do something about taking care of it, don't just sit back and whine...

You obviously have an agenda here other than the size of ints being used in the GNU C compiler. Otherwise, I see no reason why you would condemn a particular compiler for what you are describing as a flaw in the implementation of a particular library. But in the meantime, if you really think using it "would be much too hard" and that the code is "too hard to read", "Gee, that's a real pity."

Source record: 39895

>> I don't have TeX, so a TeX-format doc doesn't help me.
> You seem to have a bad attitude.

Well, maybe I do. But you see, when I go to all the trouble of providing free software for other folks to use, I also make sure I provide documentation in a format that anyone can read. I don't require folks to download megabytes of other software just so that they can format and read the docs. (Not to mention the time it takes to install and learn to use the text-formatting software.)

> I see no reason to condem a compiler...

Well, perhaps the easiest way for me to fix my little problem would be to just aquire and install a copy of GCC and work with things until my problems are all solved.

But there's this little problem, you see: I can't even figure out what-all it takes to make a working installation of GCC. There seems to be files all over the place in different directories in a.a. Nowhere is there a nice simple little doc that says "Here's what you do, starting from scratch. Here's the files you need. Here's where to find them."

I've ported GemFast to 3 compilers I don't even own a copy of. I just read some docs, looked at some header files some folks sent me, did the work, had the folks test it, and it worked. I tried that with GCC and got nowhere.

So yes, in part my problem is assuredly with a library implementation and not with GCC itself. That led me to conclude that I should ignore the library implementation that was giving me trouble and just do my own implementation. And that led me to trying to learn some things about the GCC compiler. And that led me to believe that GCC, like all GNU software I've seen or heard about, is not so much a set of tools as a way of life. You give up everything you thought you knew about using a compiler and spend a whole lot of time learning the GNU way of doing things.

I'm just trying my best to do something that a fair number of people have requested of me: make GemFast's high-level library available to GCC users. I knew before I started that this was going to be the hardest of 4 ports I have done for GemFast so far. But I really didn't expect quite as much brick-wallism as I'm running into.

So yes, all these problems make for a situation describable as "a real pity". But despite your attempts at sarcasm, it isn't a pity for me at all. In fact, if I decide to punt this project, it'll be a real boon for me. The pity will be for those who've asked for GemFast under GCC but won't get it. For my own part, I'll go on using a REAL C compiler,

Lattice C, under which GemFast works just fine in all 8 combos of arg
passing, sizeof(int) and memory models the compiler provides.

But if I sent myself a redraw event, would it be then that I reacted to the button press? i.e. Start playing music if the PLAY button is pressed. I suppose I could create my own event type to send myself, but I'm sure I tried that once and they got through too.

Has anyone actually written a program which recieves mouse clicks for windows? If so do you think you could type in a small segment code saying how you did it?

Thanks,

David.

Source record: 39898

Hey, stop a minute.

Don't get so angered with each other, that some worthwhile ports are been junked. Let's help each other instead of starting to thorw flames at each other. Nobody will benefit from that.

The great benefit of the TeX documents, is that you can in fact get some real nice output of sometimes rather lengthy documents. But that is not a reason why there shouldn't be an ascii version on the archives for those who doesn't have/use/like TeX. The GCC nroff man-page has an ascii version somewhere (forgot where I downloaded it though) which is very lucky, since my current nroff system (from MDK) does not handle all the codes in that document.

So by all means, lets get an ascii document up there. But we much also face the fact that most of us is in this for the fun, and has no time (or real incentive) to provide all kinds of combinations for all kinds of people and setups. So like so much other PD stuff, it gets done when somebody needs it bad enough.

Now, most UNIX systems has a not so bad detex program. I am willing to help on this, though I havn't got time (or motivation) to do a lot of later touching up. Anybody, mail me if you are interested.

(One could make a case for people distributing stuff in the atari world, to provide ascii versions of documentation, but I certainly wont bitch anybody about being to busy to actually do it all the time).

Since GemFast is a rather widely used library (I think, but at least for some it is the only alternative), I do hope that Ian won't drop porting it to a GCC setting. Somebody may be happy about that. So don't give up just yet, Ian.

If GemFast ports to all kinds of Lattice C combinations, I have real difficulties in seeing that one should not be able to do the same for GCC. At least I don't see what features that Lattice has that GCC should lack (surely not the sizeof function). Furthermore, if I remember correctly, all GCC libs comes in both long and short versions. The gem 32 bit lib is called gem.olb and the short version is then called gem16.olb. Does that somehow solve the problem?

Keep up the good work guys.

Does this version support the falcon (I have been told it runs on the Falcon). That is, can I access the dsp, etc, using it as I understand I could with gcc.

Also, how resource hungry is the Falcon supported version of gcc?

Thanks

I think the GCC GEM library is compatible with Digital Research's GEM library,
so no other special documentation than a good GEM descriptions is needed
normally. (Look for Tim Oren's "Professional GEM" at the usual ftp places,
e.g. at atari.archive.umich.edu.)

The GCC GEM libs originated from Ian Lempore's fastgem library (I believe --
correct me if I'm wrong), so if you need something more special it would
probably the best to ask him.

I'm doing something about this now - I too have problems with the
manual paging system, so I've written a script in tcsh to do all the
hard work, at the moment:

o You can specify multiple paths to look for a manual
directory tree, ie: 'setenv MANPATH /usr/man:/usr/local/man'
will look in both those directories (and their associated
subdirectories).

o You can give it 2 arguments in the form 'man n page' where
'n' is a number between 1 and 8 and specifies the section of
the manual to look in, with 'page' being 'fclose' or 'ls' or
whatever you want information on.

o It uses the catn directories to cache already-formatted
manual pages to speed things up.

o It searches for page.nz as well as page.n - where the z
suffix indicates the manual page is compressed. (At the
moment it pipes through zoo, but I'm going to make it zcat).

o If neither of those succeed, it runs groff on the page in
the mann directory, to produce a compressed file in the
catn directory.

o the PAGER environment variable specifies how the page is
displayed - ie: setenv PAGER more etc.

It works under tcsh at the moment, and groff 1.05. When I've got a
version that works under sh and also under the updated version of
groff (1.07 - I've yet to compile this), I'll release it as another
subset.

I was actually quite surprised at how fast it was - if you use tcsh
as your shell and MiNT >0.95 it's even faster. I wouldn't put it as
any slower than the man program that the MDK has. Also, since it uses
groff, it supports all the special codes that nroff didn't.

The only fly in the ointment is that because it's a shell script you
can't make it setuid-root (ie: takes on root's privileges when run).
The problem being that if you're running multi-user then you aren't
root, so you can't write into the cat directories therefore you don't

get the manual page.

What needs to be done is for the un*x "#!" directive to be built into
the kernel, so that you can specify what shell to run when this script
is called as an executable. When this works, the setuid bit ought to
be responsive, so the script will work (fingers crossed).

Simon.

> version 6.00.02 and this is version 6.02.

Argh! Argh! (Not seriously, but...)

I uploaded this port of tcsh 6.02 to a.a.u.e. by accident and asked the archive staff _NOT_ to move it to the ftp area.. But now it look like they (i.e. weiner) didn't receive my message.

If you use this version, please note the following:

The name of the "slash-switching environment variable" will change in the next version of my port -- I have the tcsh 6.03 port ready, and I'll upload it as soon as I get the next version of the MiNT library. (In fact, it will not only change in the tcsh port, the new name for it will built into the next MiNT Library PatchLevel which means that all new programs linked with mntlib PL>30 will use the new name.) We had to change the name of this variable in mntlib because of a silly bug in GEM 1.4, which treats the first environment variable it finds and whose name is starting with "PATH" as its file search path.

So, if you use this port, I urge you not to use the slash-switch feature, i.e. never to give that variable (whose name I will not repeat here) a value.

> GCC GEM library docs

All I've found is some portability and maintenance notes in the source code archive for GCC's gemlib. For the most part (based on looking at the bindings source), the library follows the DRI-defined GEM standards with a few (annoying, anti-portable) differences. The evnt_timer() function, for example, apparently takes a single longword instead of a pair of shorts. Also, most everything that should be declared/defined as a short datatype is defined as an int instead.

> The GCC GEM libs originated from Ian Lepore's gemfast.

I can find little evidence of that in the source code. They apparently used my gemfast.h header file, but little else. There's even a comment in the maintenance history that says "makes me wanna barf" in reference to GemFast. It was when I saw that that I realized I'm probably not going to get a lot of help from the GCC gemlib authors in getting the high-level parts of GemFast ported to GCC.

You have confirmed my worst fears: this isn't a software package, it's a whole new way of life. One that appears to require the immediate purchase of a new hard drive for starters.

> You will have installed MiNT

MiNT sucks.

> A number of shells.

CLIs suck too.

> Make you think you're operating under UNIX V7.

I can't even think of anything bad enough to say about this concept to accurately reflect my feelings.

Isn't it possible to just install the compiler binaries, the header files, the runtime libraries, and then use my own desktop-friendly MAKE to run it all?

>> the desktop needs environment variables

The AES in MultiTOS accepts environment variable changes from applications
through an extension of the shel_write() call. I don't know the details,
but this means that until MultiTOS, a CPX could trivially set env vars.

[multiple messages deleted to save disk space, bandwidth,...]

You can display all resolutions supported by the Falcon, on your
TV. I would not recommend the interlaced modes for text editing,
as some flicker will be noticable.

Considering the special interlaced modes do seem to be their to
support TV. I would not consider it an insult to connect the
Falcon to a TV, especially if you are creating a video.

Well, it certainly helps to have a hard drive at your disposal. I don't believe it's practical to use GCC without one, unless maybe you have 2 high-density floppy drives available.
>
> MiNT sucks.

> CLIs suck too.

On what basis do you make these judgements? Ignoring the issue of CLIs vs GUIs for now, what would you propose as a smarter alternative to MiNT?

> > Make you think you're operating under UNIX V7.

> I can't even think of anything bad enough to say about this concept to
>accurately reflect my feelings.

I wouldn't have said the original statement, but your anti-Unix bent is also a bit odd to me. Once again, I'm curious to know what you think is the right way to do things on an ST.
>
> Isn't it possible to just install the compiler binaries, the header
>files, the runtime libraries, and then use my own desktop-friendly MAKE to
>run it all?

Sure. It's easy. If you have a hard drive. The following is the Readme file from Gnustuff/Tos/Gcc/gcc233b.zoo on atari.archive:

GCC 2.3.3 for TOS.
The programs in this archive correspond to GCC 2.3.3 for Atari ST, patchlevel 2 (update28), plus a small optimization by me. The binaries were compiled with both base-relative and pc-relative options set, and will run as shared-text programs under MiNT 0.96 or greater. The binaries have not had their symbol tables stripped out. You can strip them to get a little space savings, but if you do you won't be able to use fixstk to change their _stksize values. Currently gcc-cc1.ttp and gcc-cpp.ttp are set to a stksize of -1, which means to consume all available RAM. If you have a TT or some other system with large amounts of RAM, you may want to pick a different value, and you may also want to set the flags in the program header to allow running and allocing from fast RAM.

To install a complete GCC system, you will also need the GNU assembler,
the C library, and the library header files, in addition to the contents of
this archive. It really isn't practical to use GCC on a system without a hard
drive, although you might be able to survive with a dual-high density floppy
system. (The main compiler binary is 820K in size, with symbols intact, and
770K stripped.)

Assuming that you're installing on a hard drive in partition C, a
standard setup would use:
C:/gnu
/bin This archive, GAS, binutils
/include GCC library include files
/lib GCC library object files

Then set the following environment variables:
GNUINC=C:/gnu/include
GNULIB=C:/gnu/lib
GCCEXEC=C:/gnu/bin/gcc-

You should also add C:/gnu/bin to your PATH, and set TMPDIR to wherever you
want the compiler to create its temporary files. A RAMdisk is nice for this
purpose, but be aware that the size of the temporary files created grows in
proportion to the size of the source files you compile.

From atari.archive, you will need:
Gnustuff/Tos/ uncompressed size
Gas/gasbin04.zoo 131K (Assembler)
Gcc/gcc233b.zoo 983K (Compiler)
Gnulib/libolb87.zoo 1210K (Library object)
Include/includ87.zoo 297K (Library headers)
Util/utlbin33.zoo 451K (Linker, etc.)

The include archive contains header files for all the libraries, but the code
for some of the libraries is archived separately:
Curses/crsolb16.zoo 276K (Curses, termcap)
Gemlib/gemolb27.zoo 152K (GEM AES/VDI bindings)
Pmathlib/pmlolb21.zoo 93K (Floating point math)

The library archives generally contain a number of versions of each library,
including 68020-specific, 16 or 32 bit int versions, and absolute or
base-relative/relocatable versions. If you're only going to need one variant,
you can save a lot of space just by deleting the others. Full source code for
everything is also provided in the respective directories. You will probably
want to grab the source code for the libraries, to see what's available. The
Curses, termcap and math libraries are pretty much the same as the libraries
on BSD Unix, so you can use the respective Unix documentation for assistance.
The C library is ANSI compliant, with a lot of Unix features added in, so it
shouldn't be too hard to figure out.

If you have any questions or problems, feel free to email me.

{messages deleted for brevity}

I would like to hear your response to Howard Chu's questions.

You do not need a CLI to use GCC. Set your GCC environment variables, easy to do with NeoDesk, and use C-Breeze. I do it and it works like a charm. The help feature of C-Breeze alone makes it worth the effort of setting up. If you are using a TT make sure you have Warp-9 to ensure the scrolling widgets all work correctly in TT-medium mode.

Someone else may be able to point you in the direction of a program to set environment variables in your auto folder.

Since when did you think the Falcon was a good computer!?

> As one of those people without unlimited amounts
> of cash to spend, when I get a Falcon I will be using
> it with a standard TV set as the display medium.
>
> Could someone tell me what display modes/resolutions
> will be available to me on such a medium?

A computer such as this truly would be horrible with a TV, as most of the resolutions would require interlacing/overscan etc, to get the wierd resolutions. It would work, but the picture would be *horrible*! (Try a 65000 color animation on the Falcon being viewed on a TV, I'd imagine it would look pretty awful, especially in something like a 640*400 or higher mode!)

The only half-decent monitor for use with a Falcon, is a Multi-Sync VGA monitor! (Or, even SVGA monitor). This will give you a crystal clear picture, and reduce flickering a great deal. With the 78Hz patch, the flickering goes bye-bye!

(By reduce flickering, I mean make it less apparent)

I've tried using a TV with my ST, and unless all you want to do is play games - you get a MAJOR headache! (Even on a state-of-the-art television...)

[lots of flamage deleted]

> Isn't it possible to just install the compiler binaries, the header
>files, the runtime libraries, and then use my own desktop-friendly MAKE to
>run it all?

YES. I just installed GCC 2.3.1, and found it quite simple. All you need are the binaries (GCC231B*.ZOO, 3 files, one of which is only for C++), the include files (INCL85.ZOO), and the libraries (LIBOLB85.ZOO). I got all of the above froM DELPHI and thus avoided the confusion of finding it in FTP.

All you need to do is copy these files into their respective directories, and then tell GCC where to find them something like this:

```
setenv TEMP i:
setenv PATH e:\gnu\bin;<your other search paths here>
setenv GCCEXEC e:\gnu\bin\gcc-
setenv GNULIB e:\gnu\lib
setenv GNUINC e:\gnu\include
```

...or set those environmental variables some other way, i.e. Gemini or Hotwire. I have successfully set up Hotwire for "point and click" compiling with GCC. I'm sure your version of MAKE should work with it as well.

I was expecting GCC's installation to be a nightmare (rather like the one you seem to be having) but it actually has been easier to install than Mark Williams C. The whole thing will take under 4 meg of disk space, 5 meg if you include the C++ compiler.

If you decide to go through with it, I can e-mail you a text file which explains how to set GCC up - the same file I stole the above list of environmental variables from. It explains it pretty clearly. The file is on DELPHI as well, and is about 14K long.

Umm, not to be picky, but I wrote the premier program for doing that,
GEMENV.PRG. It not only sets env vars from the auto folder, it lets you
change them at any time from the desktop without any need to reboot.

Also, try doing wind_update(BEG_MCTRL) which stops the AES (or the
screen manager), watching for mouse clicks - so you lose the menus
whilst this is on. Remember to do wind_update(END_MTRL) after!

This sort of behaviour normally means that the application displaying the
dialogue has not used wind_update(BEG_MCTRL) to stop button presses "falling
through". This means that Harlekin is at fault... though I find it difficult
to believe the Harlekin programmers don't know about this problem.

ST Applications has to make do with the articles it can get -- it simply
cannot compete with the page rates offered by the "glossy" ST mags. Mind
you, I would think that all those adverts for Redacteur really piss off
Compo, Working Title and Arnor who have to pay to advertise their word
processors.

I miss ST World as well :-)

>if you set _stksize to something that was too small, and some program was
>unable to get enough space off the stack for an alloca call... alloca tends
>to get used quite heavily in the GNU software...)

The real problem is, if gcc-cc1 is set to allocate RAM using malloc(), and not from the heap, it ends up with a bus error. When I set _stksize to 0L, as I would do in a multitasking environment, gcc-cpp will _eventually_ work, but gcc-cc1 fouls up. So maybe a bug in the library? Or in the atari gcc code? My gcc 2.3.3p1 is from a.a.u.e (Shareable). If someone could give me a hint where to get diffs from unix-2.3.3 to atari-2.3.3 i am willing to take a closer look at the sources (full source for atari-2.3.3 for ftp in europe is also OK).

My current setting for gcc-cc1 is -10M gcc-cpp is -2M and gcc.ttp is 8k. gcc-as 1.38pl4 works fine with 0. All programs are run from ash with job-control on a TT030/2/20 with MultiTOS 1.0 loaded.

Cheers
Oskar

Similar problems exist with 1stWord+, under _some_ versions of TOS and machine configurations... I use an acc (buttonfix.acc) to solve this.

I always thought that it was just misbehaving applications that let mouse button events `fall-thru' to other applications. If you trap the event, and use wind_update() then everything should be ok???

.Ian.

From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.ea.mWVq68_2_o2@semprini.tdkcs.waterloo.on.ca>
Source record: 39931

About this time last year, someone was collecting a list of standard keys that could be used for menu equivalents, ex:

^O - Open ^X - Cut
^S - Save ^C - Copy
^Q - Quit ^V - Paste
etc

Could they post them again, please? I think they should be added to the FAQ, so that we can all be using the same keys.

Also, I'd like your opinions on what the keyboard equivalent for specialized MultiTOS functions should be, if any... For example, what key combination should iconize your window, or make it big again (if your application has the focus)?

Evan Langlois (evanlang@sdf.lonestar.org) wrote:
[...]
: Also, such a shell should support _shell_p too. Any programs could be
: automated and expended just by having a good shell running. Your GEM
: program could then just pass the name of a batch file through _shell_p.
: How about Rexx for a script language.

How about a `standard' for shells that use _shell_p. I think something
based on the *Gulam* jump table would be good.

```
error ds.l 1 -14L
magic ds.l 1 -10L
jmp edit -6L
_shell_p jmp cmd_processor
```

What this gives us is _transparency_, older code just jumps thru the
_shell_p vector (for example the lattice C system() function), and is not
affected by the extra information. If you want to check for extra info,
then just check the magic value.

The Lattice C system() definition returns -1 if the command could not be
exectuted, otherwise it returns the value returned by cmd_processor().
I prefer an extra `error' flag, to differentiate between command return
values, and real errors. Another idea is a flag for verbosity, a lot of
people who call system() don't want their screens destroyed by error
messages (tho, they could do this: system("foo -bar >& capture") ??)

The implications of `edit' are quite heavy in a multi-tasking environment,
I am not sure how *Gulam* implements it, but I assume this would only
work in a TOS environment. Would people want an edit() feature?

I am designing a shell (called `Michelle' at the moment), but the biggest
problem is knowing what people want.

At the moment, it has:
history,
macros,
alias,
hash table (to exec external cmds quicker, if path already known),
_shell_p handling (as above, except edit() [for now]),
cmd line editor like DOSKEY on MS-Dos,
redirection (nearly!)
and
batch files
but
NO batch `lanuage', so... what is Rexx? How do I find out

about it?

NO pipes, yet, but I *will* implement them (well I like pipes!)

Michelle isn't meant to be like *Gulam*, it is similar in feel to both
Un*x and Ms-Dog, (the worst of both worlds ;-) ?).

Does anyone use *Gulam*, isn't it (with its batch language) suitable for
what Evan Langlois suggested?

Thoughts anyone?
Other features?
Why hasn't *Gulam* been suggested in this thread?

.Ian.

Cat: Is that what I think it is?
Lister: What d'you think it is?
Cat: An orange whirly thing in space!

Yeah, but they don't suck as much as XNews!

> Isn't it possible to just install the compiler binaries, the header
>files, the runtime libraries, and then use my own desktop-friendly MAKE to
>run it all?
Exactly! Why MAKE it difficult, when it can be MADE simple from the
desktop. I would like to introduce my girlfriends little brother to
programming sometime soon, and the thought alone of having him first
learn to use a CLI and numerous utilities horrifies me!

Erlend.

1481. Re: Weird Problem Upgrading to TOS 2.06

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-18 19:32:38 UTC
From: kevinb@syma.sussex.ac.uk
Message-ID: <1993Mar18.193238.29475@syma.sussex.ac.uk>
Source record: 39799

Further to the problem experienced by W.A.B.Evans (wabe@ukc.ac.uk) and subsequent follow-ups: I too recently upgraded to TOS 2.06 and now have a floppy disk drive *rgrgrrgr* which grates *rrgrggrr* in an irritating fashion. :-/

Yesterday I rang up Compo Software, manufacturers of the T_Board 64 TOS upgrade board, and found them pretty helpful. I was told that the noise results from TOS 2.06's more efficient method of reading disks, and that no damage would result from repeated disk access. The chap I spoke to said he only had suspicions as to the cause of the noise; he didn't know for sure why it happened, but that it varied between different ST's (mine is a Mega 1) and different disk drives. The step rate has nothing to do with it (as I and others had found), and there is no fix (other than getting used to it!).

1482. 17 inch monitors

> DSP, 16-bit, 16-channel, 75Khz Recording/playback....

I posted the ortiginal article to find out some others' experience with the TOS 1.2 to 1.4 upgrade. I've received nothing but alternatives whic includ the TEC board (or equivalent) and TOS 2.6.

There is not a feasible alternative including TOS 2.6. It's eith too much $$$ or requires too much technical experience, or both. >$100 for a new OS? Gimme a break! Do I look like I have a "cloner's" money-wad? :)

TOS 2.06 is NOT an option for me.

Has anyone upgraded their Mega ST from TOS 1.2 to 1.4?

Does anyone have a TOS 1.4 2-chip set for sale?

-Matt

1484. Re: Kermit and Windows

Newsgroup: comp.sys.atari.st.tech

Source record: 39796

In article <1o94kvINN9hr@golem.wcc.govt.nz>, sheppard_r@kosmos.wcc.govt.nz writes:
> Can some one explain what are Windows in Kermit,
> I have seen this option listed with version 5A.
> but what does it meen..?

The original Kermit protocol required that the send wait for an acknowledgement from the receiver for each packet sent. Original packet lengths were around 90 bytes. This meant that for each 90 bytes of text, or less if you were sending binary stuff, the sending Kermit would wait for the receiver to receive the packet and then reply with an Ack. Then it would send another 90 bytes. This was not too bad):-(if the two machines were directly connected, but as soon as you put terminal servers, X.25 or other packet switching networks, satelite circuits or similar delays between them, things slow down dreadfully.

This "feature" got Kermit a reputation for being inefficient.

Later versions of Kermit have added two functions to improve use of bandwidth.

1. Long packets. If both Kermits agree, packets can be much longer. Using 1000 byte packets from a VAX to Uniterm on the ST via a public X.25 network makes a SIGNIFICANT improvement.

2. Allow a number of unacknowledge packets to be outstanding, also know as "sliding windows". I am not exactly sure of what the figure window 0, 1 or 2 means, but I believe that it is the number of packets which the sender will allow to be unacknowledged before stopping to wait for an acknowledgement. A window size of 2 and 1000 byte packets applied to the above examples would mean the the sender would send two 1000 byte packets without waiting for the acknowledgement, send the third packet and then do nothing until it had the acknowledgement to the first packet, which should have had time to get back across the network.

My own experience is tha long packets make a big difference, and sliding windows headly affect performance over an alsmot directly connected network. I have not had the possibility to test sliding widnows across an X.25 network, but I imagine that it could keep the send channel full utilized.

Others have found that these two additions give Kermit about the same line utilization as Zmodem, but without Zmodems restart capabilities.

Setting the two parameters on a noisy network is an interesting exercise left for the read :-)

/Mike

1485. Falcon & MultiTOS speed

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-18 21:57:56 UTC
From: paetau@mits.mdata.fi
Message-ID: <1993Mar18.215756.26378@prime.mdata.fi>
Source record: 39936

Today I got the chance to see a Falcon with 14MB RAM installed. First
I got to see a demo with crystal-clear sound and very nice pictures in
truecolor, but when I got to testing the machine with Qindex I was
shocked. With the 256 color mode all but one of the tests concerning
text output were under 100%, compared to TOS 1.4 monochrome. TOS
Scroll test was 16%! This was not under MultiTOS, would it have been
even slower then? So tell me, is the 256 color mode relly this slow,
or is there something fishy about this? Browsing through documents in
this mode would be a genuine pain, one page takes at least 5 seconds
to display! When I switched the resolution to ST Medium, I got 200%
for TOS Scroll, which looked pretty nice, but the 16% really bugged
me. The CPU specific tests were ok, I got 362% on CPU memory in the
256 colour mode, ST Medium was 469%. The TOS version was 4.01.
What bugged me even more was the speed of MultiTOS. A program called
LINES.APP that made a nice pattern of coloured lines bouncing at the
screen was fairly fast in TOS 4.01, but in MultiTOS it was sluggish
even when it was the only application running. Executing it another
time and adding mintshell resulted in such slow action that it would
have required nerves of steel to work at the machine for more than 2
minutes. When you tried to select a window you had to press the mouse
button several times befor the window was activated. This was in ST
High resolution. MultiTOS version was, I think, 1.0.
If it really would be this bad, why hasn't anybody complained? Maybe
it was something with the setup or something, old versions of the OS
perhaps? What factors influence the speed (besides multitasking)?
There were about 30 fonts and SpeedoGDOS loaded, at least they took a
long time to load from the HD. So please folks, tell me something is
odd here? It can't be normal that a Falcon scrolls with 16% of the
speed that an ST scrolls, can it?

Source record: 39935

> standard keyboard equivelents for GEM menu items

Atari has created a list of standard key equivelents which (they say) all
applications should use. (This is from the MultiTOS User Interface
Guidelines chapter of the Falcon docs):

^N - New
^O - Open
^W - Close
^S - Save
^P - Print
^Q - Quit

^X - Cut
^C - Copy
^V - Paste
^A - Select All
^F - Find
^H - Replace
^G - Find Next

[Delete] - Delete
[Undo] - Undo
[Help] - Help

They also recommend that the ALT key *not* be used for keyboard command
shortcuts, since it is used as a character modifier in some countries.

> Falcon 256-color mode...is it really this slow?

Yep, it really is. I find that the Falcon in 16-color modes (I use 640x480x16color on a VGA monitor) are quite usable; faster than the ST Medium rez I'm used to from my old 1040. But 256-color Falcon modes are too slow for any serious work. Even with a program that bypasses VDI and uses hand-tuned asm code or blitter operations to directly access the screen it's too slow. I attribute this to Atari's (IMO, ill-advised) decision to use interleaved bitplane format for the pixels instead of packed-pixel where each pixel would be stored as 8 bits in a single byte.

> MultiTOS speed...why hasn't anybody complained?

I've complained. I've even been flamed for my complaints. I laugh at the flames in response to my complaints, knowing that the people posting them have never seen MultiTOS on a Falcon, and are defending it based on religious beliefs that it is something wonderful. As you point out, if those folks were to sit down and actually try to USE it, then after about 2 minutes they'd be singing a whole different tune.

As a single-tasking machine, using relatively undemanding graphics modes, the Falcon is a very nice system. I have the feeling that the so-called multitasking, and the more demanding graphics modes, are there just so that the marketing types can make plausible claims that the machine can do wonderous things that are comparable with what other manufacturers can offer.

I'm not going to flame - it's just that I've used MiNT 0.99 and other pre-MultiTOS versions, which have the SAME code in 'em, on my "old and slow" Mega STe, and gotten pretty reasonable performance. It's slower than using stock TOS, but that's what you get when you go to a preemptive multitasking system.

Apparently, in the couple of weeks between 0.99 and the final version you received, new bugs must have been introduced that make it run slower on the 68030 than it does on a 68000 that sort of fakes 16 Mhz.

Either that, or GCC, which I used to compile MiNT, does FAR better optimization than Lattice C (which is what Atari is using to compile MultiTOS). In which case Atari probably ought to change compilers...

> As a single-tasking machine, using relatively undemanding graphics modes,
>the Falcon is a very nice system. I have the feeling that the so-called
>multitasking, and the more demanding graphics modes, are there just so
>that the marketing types can make plausible claims that the machine can do
>wonderous things that are comparable with what other manufacturers can
>offer.

There's "smart" ways of using multitasking, and there's "dumb" ways of using multitasking. It seems to be highly common for the demos that people try to be "dumb" ways of using multitasking.

If you use it to set up applications that hog CPU resources against one another to compete one another to death, then OF COURSE the performance will be lousy. The typical sort of graphics demo is certainly such an application.

When I was playing with some Windows demos a while back, I did my best to "abuse" the system. I got about 30 windows on the screen, each trying simultaneously to redraw some kaleidoscope. It started swapping processes off to disk, and eventually crashed quite gorily. But I never expected any better than that - I was doing about the most

resource-hungry sort of "test" that I possibly could. It wasn't a question of whether the system would crash - it was merely a question of how soon.

The way that multitasking is REALLY useful, in ways that will be OBVIOUS to the average user is when it allows you to run (say) Calligrapher and LDW Power simultaneously. They won't kill one another off performance-wise (there could be some memory contention problems, in that the applications may be written to assume that they can take all of the memory for their own use, but that should be solvable via one or the other of the utilities), and you'll be able to cut and paste back and forth. Oops, I left some data on the mainframe. No problem, just load up CoNNect or Flash, and download it.

It's not how badly a demo can abuse the system that's important - it's whether you can do something real with the computer or not.

>question but I have to ask.

It won't provide you with more fonts in Pagestream (or for that matter
in Calamus or TeX or anything that's GDOS-based).

The only advantage it MIGHT give you is that it might allow you to
have a bigger print buffer, which lets you finish print jobs (at the
computer level) somewhat earlier.

This is true for most programs that claim to be "printer independent"
or "supports many printers." The reason is that Pagestream (and
similar friends) do not use the fonts that are stored in the printer;
they generate bitmaps that get dumped to the printer directly.

The SoftCart might be useful with something like WordPerfect; I know
that the IBM version of WordPerfect supports some of the DeskJet font
cartridges. WriteOn may also support the additional fonts; it uses
the internal fonts as well as generating its own fonts.

Beyond that I don't know...

>Can some one explain what are Windows in Kermit,
>I have seen this option listed with version 5A.
>but what does it meen..?
Kermit Windows (they are actually called "sliding windows") are an
extension of the basic Kermit protocol that greatly speeds up transfers
thru networks and other "long turn arround time" links.

The sliding windows extension permits Kermit to send packets without
waiting for reply packets (ACK/NAK packets) to get back and indicate
success or failure. The "window" is the maximum number of packets that
can be sent before the reply packet MUST arrive. This "window" slides
along the transfer as it progresses.

For example if you set a Kermit that supports the sliding windows
extension for a window size of 6, then Kermit will continue sending
for up to 6 packets before waiting for replies. If the reply packets
begin arriving before the window is full, then Kermit never waits
at all and sends packets continiously durring that transfer.

Any reply packets indicating failure (NAK packets) of a given packet
to be recieved correctly, causes the Kermit to repeat that ONE packet
out of order, then continue sending new packets. The receiving Kermit
then puts the out of order packet back in its correct place in the
file. No packets other than the actual failed packets get repeated.

That is Windows in Kermit.

There are quite a few good monitors out there... here are some I have
heard of...

TVM Mediascan 6A digital $1108 expensive but a very _very_ good monitor
NEC 5fg $1350 but it is one of the best monitors made Period.
Amdek am/817 $1041 good at resolutions below 800x600 and is cheaper than most
Sony CDP-1604s $1159 uses color stripes which make round pixels. trinitron

the NEC will cope with pretty much every mode you can throw at it... the
others I don't really know.

*steve miller
*dept of electronics engineering, cal poly san luis obispo
I have a Final in Analysis and Design of Digital Integrated Circuits tom.
so I don't really know why I am on the net at this hour... :P

Yeah, did you know that the Eagle 040 needs a HD TV for display? Only
a HD TV can display the 1250 lines correctly at 100 Hz.
(just kidding of course, since Atari never would release such
information before HD TV's are available to the general public :)

Yes, and what about the e.g. German translations of the Menu entries.
Like File <-> Datei , Save <-> Speichern or Sichern.
Of course the keys would have to stay the same no matter what language
is used.
By the way, Atari has official guidelines available to developers that
tell what keys to use.

>Could they post them again, please? I think they should be added to the
>FAQ, so that we can all be using the same keys.
You could get the first few keys to use from the desktop of TOS 2.06.
Atari has always said, that if one needs an example of how to do
something, do it like the desktop does.

>Also, I'd like your opinions on what the keyboard equivalent for
>specialized MultiTOS functions should be, if any... For example, what
>key combination should iconize your window, or make it big again (if
>your application has the focus)?
Hmmm, I think Atari will soon describe a way to do so. No doubt they
will also tell us what key should make the window/program iconize.
Icons are made big again by double clicking on the icons. Programs get
an event for this double click. Multi-TOS programs that support
iconizing listen for this double-click and for dragging to move the
icon or make it big again (icon==window under Multi-TOS, I don't know
if a mask is possible to hide the window border)
But for the time being, why not use the TOSWIN standard alt-I for
iconizing. Changing the scancode is a pretty minor upgrade to any
program.

>Beyond that I don't know...
Well there is always 1st word plus and Le Redacteur. They must be able to use the extra fonts that are available, except maybe the landscape fonts.
And one definite recommendation for a program to use the cartridge with is MultiWriter. The follow-up to ST-writer Elite, except that it works with Multi-TOS and has lots of other features. It will only use the printers built-in fonts so it is ideal for use with such a font-pack. MultiWriter supposedly also reads and writes many formats like Wordperfect.
One last advantage of the soft font pack in combination with a suitable text-processor (another good one comes to mind: DB-writer (PD)) is that print-speeds can be much much higher, since ascii characters can be transmitted, so there is no need to send large amounts of pixeldata to the printer.

>Scroll test was 16%! This was not under MultiTOS, would it have been
>even slower then? So tell me, is the 256 color mode relly this slow,
>or is there something fishy about this?

256 color mode is slow - compared to the monochrome ST mode. But that
is not 'fair'. Now 8 times as much memory is used.
Just compare it with a 386DX running under OS2 with
256 colors: that is very slow, too. Don't forget: MultiTOS is real
multitasking unlike Windows! Just imagine how fast UniX is on 'small'
Sun Sparcs...

In 16 colors it is really ok. Especially when one renices the unneccessary
background processes and accessories.

What is really bad is, that there is no Warp9 or NVDI to make the
drawing much faster - like on every ST I know. That will make things
much better in a few months.

The mouse click thing is a problem. Sometimes the AES forgets clicks. That
is not so much a question of speed - more of correct programming I would
say.

>have a bigger print buffer, which lets you finish print jobs (at the
>computer level) somewhat earlier.

Sorry, but that won't work as fas as I can remember. Extra RAM added via cartridges cannot be used as printer buffer. It is very interesting, though, that de Deskjet supports 600x300 (Yep, 600!) dpi for its fonts as opposed to 300 dpi in graphics. So I'm still waiting for a dvi-driver that makes use of downloading for the Deskjet 500 and can thus use 600 dpi horizontally, which would make certain letters such as w's and v's much nicer. And it would print faster.

>This is true for most programs that claim to be "printer independent"

>if you set _stksize to something that was too small, and some program was
>unable to get enough space off the stack for an alloca call... alloca tends
>to get used quite heavily in the GNU software...)

The real problem is, if gcc-cc1 is set to allocate RAM using malloc(), and not from the heap, it ends up with a bus error. When I set _stksize to 0L, as I would do in a multitasking environment, gcc-cpp will _eventually_ work, but gcc-cc1 fouls up. So maybe a bug in the library? Or in the atari gcc code? My gcc 2.3.3p1 is from a.a.u.e (Shareable). If someone could give me a hint where to get diffs from unix-2.3.3 to atari-2.3.3 i am willing to take a closer look at the sources (full source for atari-2.3.3 for ftp in europe is also OK).

gcc-cc1 needs at least 100k of stack!! Setting _stksize to 0L will
only get you a stack of 2K. I normally set the stack to 300k which is
enough even for big functions to compile without stack overflow.
Remember that GCC makes heavy use of alloca()!
The same goes for gcc-cpp, which slurps your complete source code into
the stack, so _stksize must be bigger than the biggest source file you
want to compile.

1504. Need help with some EPROMS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-19 12:50:04 UTC
From: ga@mrih.no
Message-ID: <1993Mar19.125004.403@ugle.unit.no>
Source record: 39809
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a M4STE. In it was two D27C010's which made out the 256 kB of TOS 2.05.
I then got a set of AM27C010's to burn TOS 2.06 on. Well, 27C010 should be
27C010, I guess, but alas... no... When I inserted the newly burnt EPROMs,
I got the normal startup, with the exception that instead of the Atari logo,
I get the correctly size box, but a lot of crap in it... takes a while, and
I then get three bombs before it resets and starts all over again.
After having resetted 34 times, it manages to load the bootsector, on which I
have put a TOS loader, which uses BIOS to load the file, as GEMDOS does not
work... Now, if we divide the ROM in four 64 kB blocks, A, B, C and D, instead
of having them in the sequence ABCD, I discover I have ABBB.
Moving two of the straps gave me the combination ABAB, but C and D still is
not to be found. Clues, anyone?

Please answer by email, as I'm not on this group often enough to keep up with
everything... Especially now...

Hey all.. I'm trying to find out about the availability of background fax software for the St. Right now I use StraightFax, but that won't work in the background. Also, is there software that will work with Zycel modems in the background (or foreground) that support fax and/or voice capability?

And, still on the modem topic, are there programs available that will lock the older plain ST serial ports at higher-than-19.2 speeds? I tried one once, and it dropped lots of characters...

Please mail info... and I'll pass it on if requested... thanks!

First thing to do is delete the laser shell to save precious disk space.
Then, pick up a copy of gulam or similar, and stick with that for development.
You might have to learn to use a CLI, but at least you won't turned off
development forever like you would be if you tried using the laser editor.

1507. *UK* CUB Colour Monitor. 50 pounds

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-19 16:56:15 UTC
From: kiddlejc@vax.sbu.ac.uk
Message-ID: <1993Mar19.165616.1999@vax.sbu.ac.uk>
Source record: 39812

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
Ive got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you cant say fairer than that, can you.

Bear in mind that the Future One True Operating System of the ST will be
MultiTOS. From what I have seen of MiNT, a bare-bones ST will be rather
sluggy running multiple tasks; but I wouldn't call MiNT half-cooked. It's
pretty stable by now.

Of course, I'm a Unix user and a bit biased; but then so are you ;-)

Greetings,

Jens.

>(as I and others had found), and there is no fix (other than getting used to
>it!).

This ABSOLUTELY confirms my findings too - there is NO seekrate
speed which gets rid of this *rgrgrrgr* sound. 3ms minimises it but does
NOT get rid of it.

Still one suspects Compo "may" have something to do with it for
their manufactured 2.06 chips (mine were also made by Compo) have been
"doctored" at least minimally else the default seek would come up as 6ms
(and NOT 3ms that actually happens with my chips) as several other netters
have reported is the case with their upgrades. In principle this is a good
idea for it obviates the need to reset the seekrate for the non-HD drives
these chips will be used with.

BUT! could it be that in doing this they altered other things too?
(It is easy to be "too clever" at byte changing). Might some other mod they
made be now having the side-effect of causing this awful grating sound?
Other TOS 2.06 (non-Compo) do not appear to have this problem provided the
seekrate is adjusted (as seems to be the concensus of the opinions expressed
in this Newsgroup and directly also to me personally).

As for "no damage resulting from repeated disk access" despite
this groaning agony sound - well, I take that with a big pinch of salt and
am reminded of Mandy Rice-Davies ("He would say that wouldn't he?"). Disk
drives ARE mechanical devices and there is no mistaking the sound made by
an "overstrained" mechanical component.

I, for one, will probably change back to my original TOS 1.60 chips
(despite its bugs & limitations) in the near future.

Is there any way to get GNU C++ without spending most of my natural life downloading (or FTP'ing) it? Considering I usually get less than .2 K/sec on an FTP "get", I don't want to try that. Downloading 10 disks of stuff at less than the equivalent of 2400 baud would sort of suck. perhaps a usergroup or somesuch?

1518. bitplanes

Newsgroup: comp.sys.atari.st.tech

From: ltduck@access.digex.com
Message-ID: <1oddufINN69g@access.digex.com>
Source record: 39818

As to your condemation of bitplanes, I disagree. You say that it would be better to have (in the 256 color mode) 1 pixel per byte. This is fine and good unless you want to have sprites. With 8 bitplanes, you can have 8 single color sprites moving about the screen without having to do ANY boring (and slow) bit logic. Sure, it would be nice to have 1 pix/byte for text and stuff, but FUN programs would really suffer.

1519. XFormer Stuff

w>Tex files are not plain ASCII, they are usually a real pain to read without
w>stripping the control characters out!

There's a nice utility called TEX2TXT here in Germany, which can interpret a .TEX file and output an ASCII equivalent of the .DVI file TeX would produce.

It supports many of the TeX features, e.g. \itemize, \include, \tabular, TeX's hyphenation algorithm, just to name a few.

The author is Roman Hodek, his email address is Roman_Hodek@n.maus.de

I don't know if TEX2TXT is available via ftp. Sitting here in a german hobbyist BBS net, I don't have ftp access and only very limited access to Usenet newsgroups, so please don't aks me to upload it or post it to comp.binaries.atari.st (I think the same is true for Roman). But maybe there are MAUSNetters who can upload it somewhrere...

Regards,
Andreas

What's "chunky pixel" format? The Falcon uses interleaved bitplane format for the 1-8 bitplane graphics modes, and packed-pixel format for the 16 bit mode. I can see that sticking with the interleaved format allowed for greater compatibility with software that writes directly to screen memory. But, since the 16 bit was already packed-pixel format, i.e., there were already going to be 2 different formats needed, perhaps they should have made the 8-bit format packed as well. So it goes.

1522. short versus int in GEM programming; an allegory

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-20 02:19:06 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Mar20.021906.12560@mnemosyne.cs.du.edu>
Source record: 39826

In the beginning there was the 16-bit compiler, and the 'int' datatype, and the GEM programming idiom was to use 'int' for everything. Programmers, in their ignorance, worshipped the false god of 'int', and were blissful. There was much making of merry, small furry creatures were sacrificed and consumed with abandon, and the feasts lasted far into the night (with the help of coffee and Jolt Cola).

The gods looked down on the programmers, and they were angered, for gods have never been able to abide happiness amongst the mortals. (Also, the loud partying was keeping them up all night.) So the gods caused to be created the 32-bit compiler for the Atari ST machines. The pestilence of the 32-bit int settled quietly upon the land, but the gods were patient. They knew a time of great trial and tribulation was about to descend upon the programmers.

Upon the earth, trouble was brewing, although those at the center of the storm were hardly aware at first that anything was happening. There came to be a variety of religious sects, each with its own way of worshipping.

The sects known as HSC, Sozobon, MWC, and Laser C were egalitarian in nature. The believed that the holy words 'short' and 'int' had equal power, and they did not examine the arguments of their worshippers closely.

The powerful sect known as Lattice came to discover that the holy words did not contain equal power. The high priests at HiSoft declared that the holy word 'short' was The One True Way to address prayers to the GEM gods. The demigod Atari was pleased with this new method of worship, and endorsed its use by distributing example source code using the new proper method of worship.

Another powerful sect, known as GCC, also discovered the unequal powers of the 'short' and 'int' holy words. One high priest in this sect declared, "Worship the gods only through me, and you may continue to use the 'int' holy word. I will translate this for the GEM gods as needed. I will be your intermediary, but only if you are faithful to my ways." This pleased many programmers recently converted to the GCC sect, for they could reuse their existing prayers without change.

The programmers were a good-natured and easy-going bunch. Even though they had different methods of worshipping, they recognized that there was power in the prayers offered by other sects, and they wished to share and exchange them. The GCC and Lattice sects were not as easy-going as the older religions, however. They examined closely the arguments made by the programmers, and rejected those that used improper holy words. Finally the pestilence sent by the gods in chapter 2 began to rear its

ugly head.

It came to pass that the high priest of the HSC sect undertook a reconciliation of these differences. This priest had assembled a large book of hymns in praise of the GEM gods, and wished for all programmers to have access to it. He examined the issues involved, and decided that the Lattice method of worship was more correct. The endorsement of the Lattice method by the demigod Atari weighed heavily in his decision. The fact that the GEM gods themselves (within their innermost sanctums) also used the holy word 'short' -- well, this could not be dismissed lightly, and also lent weight to the decision. A week or so was spent converting the massive hymnal to use the Lattice holy word 'short'. Another week sufficed for the conversion of all the private prayers this priest had created over the years. (The Lattice compiler simplified this conversion, by pointing out the places where the old holy word of 'int' could no longer be used. And the HSC compiler, was as ever, egalitarian, allowing either word interchangibly in most situations.)

The HSC high priest knew that his mission was not completed, however. There remained the task of reconciliation with the powerful and ever-growing GCC sect. He sent a dispatch to the high priest of GEM worship for the GCC sect, attempting to open a dialog by outlining some of the issues involved, and urging that the GCC high priest discuss with him the implications of a change in the method of worship. GCC's high priest promptly responded, implying that the HSC high priest was a charlatan and blasphemer, and stating quite clearly that there would be no discusion of philosophy.

The GCC high priest made, however, what he surely considered to be a magnanimous offer to the HSC high priest: "Send me your hymnal full of blasphemy, and I will rewrite it in a way that is compatible with all prior methods of worship. This I consider to be a trivial task, though I have never seen your hymnal, and really care not what it contains." The HSC high priest shook his sadly at this, knowing that the hymnal contained many advanced forms of worship that the GCC priest had (by his own admission) never encountered before. He knew this wasn't the sort of problem that could be solved with a typedef or two and a couple macros.

The HSC priest was sorely troubled by this turn of events, and undertook many hours of meditation in the desert. He undertook strenuous exercise and a fasting diet during this period. (This had nothing to do with the problem of how to worship the GEM gods, he just wanted to lose some weight. But it did serve to darken his attitude.) Finally after much meditation, a great truth was made known to the the HSC priest:

This is not a matter to be solved by gods, demigods, or priests, for they live in isolation from the day-to-day troubles of programmers. The programmers must decide for themselves, and make their wishes known to those who craft their hymnals and translate their prayers.

And so the HSC high priest decided to bring this matter into the temple to be discussed by the entire flock. He did not truly expect a complete solution to come of this action, for he had tried such methods before, and had gotten responses from the flock ranging from abject indifference to contentious bickering. Still, this was a matter too important to be decided by the few, so he began to prepare sermons to be preached to the flock, that they might come to know the troubles suffered by those who create the hymnals and translate the prayers offered up by the flock. And also that he could learn of the concerns of the flock, for this priest not only preached to his flock, but also listened to them.

And this history is the first of those sermons. Amen.

1523. Re: short versus int in GEM programming; details details

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-20 02:21:43 UTC
From: ilepore@nyx.cs.du.edu
Message-ID: <1993Mar20.022143.12670@mnemosyne.cs.du.edu>
Source record: 39827

There is, as I see it, only one argument for continuing to use 'int' as a datatype in the GEM programming interface: A large mass of code exists already that uses it. That is a powerful argument, not to be trivialized. One person fed me a line about int being "the natural word size..." and thus the proper datatype to use. Frankly, I consider that to be dogmatic twaddle; doubly so because the person refused to cite any reasons or background for such a statement. If the use of the 'int' type carries any inherent advantages other than prior use, I'd love to hear about them.

On the other hand, I feel that I can cite a number of reasons why the 'short' datatype has advantages in GEM programming...

First and foremost, it is the datatype used internally by GEM. In VDI programming, when you pass an array of xy coordinates or integer parameters, it expects them to be 16-bit (ie, short) values. In AES programming, there are also many 16-bit quantities, eg, the x,y,w,h values describing objects.

It is true that the interface between your code and VDI/AES in the system (ie, the bindings) can perform size translations on the values passed to the defined entry points. If 32-bit int values are passed, the bindings can transcribe them into an array of shorts before passing the values along to the OS. This isn't a very efficient process, it wastes memory and CPU cycles. It also imposes artificial limits on the number of xy coordinate points passed to a VDI function. You can't pass any more coordinates than there is room for in the pre-allocated arrays that are used during transcription. So you end up with either artificial limits, or ridiculously large intermediate arrays, most of which go unused in the average program.

A more subtle problem occurs with some of the aggregate data types used in AES programming. In the OBJECT structure, the x, y, width, and height fields combine to form a standard GEM aggregate type, the GRECT. This sort of embedded GRECT appears within other GEM structures, such as the PARMBLK and ICONBLK. It is not unusual to use (GRECT *) cast expressions to access these embedded xywh values as if they were in fact defined as GRECTs. (Some would argue that it is wrong to do so, but it is not unusual. And I don't think it's even wrong.)

If the elements within a GRECT are defined as shorts, this doesn't create any problems. When the elements are defined as ints, problems arise when the compiler uses 32-bit ints.

Now to the real crux of the problem: portability. As previously mentioned, the Lattice C compiler authors have choosen the route of using the 'short' datatype exclusively where aggregate datatypes and pointers to variables

into which GEM returns values are involved. Lattice allows you to select 16 or 32 bit ints at compile time, but your GEM code works either way under Lattice, because 16-bit values are always declared as short. The GCC compiler also allows 16 or 32 bit ints at compile time. It, however, uses the int datatype throughout, and the bindings perform conversions.

Our problem is that code written for Lattice won't work without changes under GNU, and vice versa, without manual conversion. Because HSC, Sozobon, Laser C, and MWC don't support prototypes, they tend to be happy with parameters of either datatype. HSC is a bit picky about pointer type mismatches in assignments, but this is something that (in my experience) is rarely ever an issue. If it comes up at all, it tends to be in one or two isolated instances in a program, and can be fixed in a matter of moments.

You may have noticed that I haven't mentioned TurboC at all. It does support prototypes, and also uses the 'int' type throughout the GEM interface. However, in TurboC an int is always a 16-bit value. I believe (although I haven't tried it) that one could tweak the Turbo GEM.H header file to use short instead of int in the prototypes and structures, and the library itself would still work just fine.

This leaves us with a problem of where to go from here. Do we say that the existing mass of GEM code which uses int when declaring arrays and pointers is the winner, by sheer weight of prior art? In that case, what do we do for Lattice C users, tell them to bugger off? And what about the fact that Atari themselves are now Lattice C users? Do we tell them to bugger off too? Do we lobby HiSoft and Atari to fall into line with the prior art practice, and rewrite the GEM bindings for Lattice C?

Or do we declare that HiSoft has shown us the enlightened path, by using the short datatype throughout the GEM interface, and thus require a period of mass conversion of existing source code where the int/short conflict must be resolved on a case-by-case basis as programs get maintenanced? (It is important to note that this path requires a rewrite of the GCC GEM bindings as well. But that at least is something within our power to do, since the source code is available.)

I am, of course, less than a neutral observer in this matter. GemFast is no longer the little toy set of bindings it once was. It has grown into a library containing several hundred kbytes of C source code in about 100 modules. A while ago, I converted all that code to (what I assumed to be) portable C code that doesn't use much in the way of dirty tricks with recasting or assumptions about the behavior of the underlying bindings. One assumption I did make though, (one that turns out to be unfounded) was that anyone working in an environment of 32-bit ints would naturually tend to use 'short' as the declaration for the 16-bit datatypes that GEM programming relies on. I can't escape a gut-level feeling that short is the right way to go on this issue. But I also can't single-handedly impose that prejudice on the rest of the world. So I need to hear from all of you who are out there writing GEM code. (Even though I sometimes think that there can't be more than a dozen of you left who still write

GEM code, instead of giving in to the laziness of programming for a CLI-
only evironment, "because it's easier to deal with.")

If you are reading this on usenet, please reply on usenet, rather than
by mail. Any replies on this issue which are mailed to me will be promptly
reposted publicly on usenet. This is not something for me to decide; this
is something that bears public discussion.

There are already quite good and running programs for the ST that can
convert TeX/LaTeX source or even DVI-files into "nicely" formatted ascii
output. Scan your favourite server for tex2txt, tex2asci and dvi2tty.

So everybody can still distribute TeX docs (the only truely universal format
for nicely formatted text) and the reader can either install TeX for
maximum quality or just a small converter programm for pure text.

I believe all of the 2.3.whatever stuff is there in the "G++"
directory. Versions 2.0 and above have c++ included. I'm using such
a version, but didn't bother with the c++ binaries. Then again, you
may want to just user version 1.4x, which is smaller and simpler.

From: lehmann@cs.tamu.edu
Message-ID: <1ofip7INNs3f@tamsun.tamu.edu>
Source record: 39834

I have been playing around with INIT to finish the UNIX-izing of my
Atari ST.

While I like INIT and it does seem to work well in a single session at
a time mode, I really want it to do the following:

- take me into GEM after loggining on
- set global permission variables so that I can view files from
my home directory but not my wife's protected file under the
Minix file system.
- pass all USER and HOME variables to the TOSWIN shells (BASH, TCSH, KSH, etc.)
so that these program work correctly
- when I log out (I don't know how to do this in GEM) I go back to the
command prompt.

Can anyone give me some suggestions. Simon Gornall has already given me
some hints, but his information was mainly that I will have some trouble
with the exiting of GEM.

How would I go about writing a "/bin/logout" program to exit GEM and go
back to INIT?

So do I. In fact, I would have been happy to see all other UK Atari magazines disappear, rather than lose ST World. I'd almost be willing to say the same for all US Atari mags, although I'd hate to give up Current Notes (which is a good magazine with a totally different orientation).

For a while, there was talk about reviving ST World, which was sounding fairly serious. What ever happened to that?

ST World had a programmer's column by some bloke whose name I don't recall ;-), that had lots of useful information. I frequently picked up tips there that I saw nowhere else.

> | mjl-b@minster.york.ac.uk | a bit of a girl's name?" "It's short for... |
> | University of York, UK | Bob." -- Blackadder II |

I'd like to check out ST Applications, but at $50-60 to get it in the US it would have to be awfully good. And I'm certainly not going to risk that kind of money just to find out if it is any good (for my purposes).

I have a peculiar problem which seems to keep croppping up on my Mega ST4.

I've heard that the power-supplies on these have a tendency to go bad, am I hold it as the main suspect; however, my technical experience is _very_ klimited, so any advice would be appreciated.

The Problem/Sutuation

I (currently) have no Hard-drive. I regularly use a 1.7MB Ram Disk. The problem is that every so often, when booting, when the RamDisk tries to install itself, it fails and comes back with a "Sorry -- Not ERnough Memory" error.

This usually (but not always) manifestes itself after I've had the computer on for a while already and am re-booting. Turning the computer off for a while usually (but not always) seems to cure the problem.

Could i say, definately, that the weak power-supply is the problem?

Do you think they display a better image than the Falcon on the same TV set? No, they won't. The C64 doesn't even have RGB outputs, and the Amiga cannot do higher refresh rates either. How should it? TVs are limited to 50 (Europe) or 60 (USA) frames per second with 15.625 kHz hor. scan rate. There is nothing one can do to change that.

I have to say that I've used MiNT for extended periods as a development environment, and taken advantage of being able to compile in the background whilst browsing other source and documentation.

I never had any real complaints about its speed... if you play a little with the process priorities (say using any one of several CPX') you can tweak the system either way - depending on whether you want it to jump when you say so, or whether you're leaving it alone for 5 mins or so and want the compile to scoot along. (I just hope they have fixed the way that the AES eats CPU time by now 8( )

Having said this, I should point out that I _am_ talking about running on a TT. I have had no experience of MiNT on a falcon, however I suspect that it could be a little sluggish.

i> As a single-tasking machine, using relatively undemanding graphics modes,

I have to agree with you here, with a few reservations. MiNT will probably serve quite well as a task-switcher, in much the same way as 99% of Windoze and MultiLoser installations do. Certainly it shares a great number of

their drawbacks when it comes to loss of responsiveness - an issue which atari can probably address with a serious look at the scheduler (ie tweaking it to drop everything and grab the thread responsible for the most recent user action etc...).

1538. Re: short versus int in GEM programming; details details

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-21 15:53:51 UTC
From: leo@dcs.warwick.ac.uk
Message-ID: <1993Mar21.155351.18090@dcs.warwick.ac.uk>
Source record: 39843

short vs int?

They should be the same thing for GEM programming and if your compiler doesn't support 16-bit ints then you should throw it away.

Why?

Everything takes significantly longer to do in 32-bits (especially on the 68000). eg.
a) i=j*k where i, j & k are integers takes between 3 and 5 times as long with 32-bit ints since the 68000 has no multiply long instruction.
b) a[10] involves a multiply - see above.
c) All function arguments must be prompted to integer before being put on the stack. This means that even putting a 16-bit value on the stack needs twice as many memory accesses and twice as much stack with 32-bit ints.
d) switches take longer because they work on a 32-bit range.

Even on an 68030 32-bit ints still take up twice as much space and take slightly longer to access (Because they fill up the cache quicker).

16-bits is far large enough for a general purpose integer variable, and you can use long if you need 32-bits.

Note that I am talking about GEM programming here. If you are porting Unix stuff then a 32-bit integers safe a lot of hassle.

I think that it's the disk head of the drive moving in bigger steps (like
30 sectors in one go) instead of scanning those 30 sectors before it
reaches the sector where the next bit of data is stored which the disk-head
was looking for (IMHO).

I am curious. Did the Laser C shell actually get worse since it was released. I seem to remember the magazines and Atari groups raving about how exellent it was (in 1988). Also the people mentioned have great it was that a programmer didn't have to use a bare minimum cruddy editor like thing called "vi" or "emacs". Also (and I think Ian Lapore will agree on this) it stayed totally within the GEM environment.

I bought it. I even use it sometimes when I need to debug code. I have yet to use a better debugger than the one that came with Laser C.

Now, I don't believe the things that people told me, but I do think it is funny how the same compiler went from praise to horrible slop in ratings when the compiler itself has hardly changed.

>I use Gem Zmodem from Michael Ziegler, Connect 1.95 and a ZyXEL 1496E 5.04
>modem, in case you should know of some troubles with that combination.

i hunted for that one for some time too (me: mega STe, uucp on modem2,
corrupted files and no protocol errors), and finally found out its a
hardware problem :-(seems whenever the SCC chip (controls modem2 and
serial2, $ffff8c8x) gets accessed during disk IO theres a chance that
this access trips over the disk DMA reading/writing memory and then you
get corrupted data sent either to/from the disk(!), or the port, or
both. and the chip is accessed in interrupt handlers whenever data goes
over the port or CTS changes...

i know of no real (hardware) fix for that (there is a patched GAL for
another bug concerning serial2, haven't tried that yet), the `solution'
i'm testing now ist to have the disk driver (actually cache program)
call a routine (cookie) that drops RTS and turns off SCC interrupts
before DMA and restart everything afterwards. that _seems_ to do it,
except the modem apparently ignores RTS until it has a connection
so uucico's dialer now sometimes misses modem messages and times out
when other processes use the disk...

hope it helps,
Juergen

PS: maybe it's not only mega STes... there was a report in one of the
maus. newsgroups about a falcon running a disk reorganize (chkdsk3)
that crashed horribly when the phone rang and the modem sent `RING'...
(falcons modem port is on SCC too.) poor guy had to clear out the disk

and reinstall everything...

>> Laser C shell
> I think Ian Lepore will agree with this: It stays totally within the
> GEM environment.

I have mixed feelings about it. While the idea of an integrated development environment using a GEM shell seems nice on the surface, programmers tend to be very religious about editors. So forcing a given editor on them isn't likely to work well. What the world needs is an IDE that allows you to specify your own favorite editor.

I've learned to live with (but not love) the Lattice C IDE and its editor. But when I have serious editing to do, I still move the source over to my MSDOS machine and use kedit (which uses rexx as its macro language). But for fixing typos and simple glitches during edit/compile/test cycles, the Lattice IDE editor is good enough.

I tried the Laser C IDE long long ago, using a borrowed copy. I didn't like it enough to go buy it, so I threw it away. Now I can't remember enough about it to comment on it. (Except I remember it had hooks in the GEMDOS vector to manage some fancy file caching, and a bug in those hooks would trash register D3!)

My solution has always been to use the GEM desktop as an IDE. My make utility can be installed as the application to handle double-clicks on files of type .MAK, so dclicking a makefile.mak runs the compiler. My favorite ST editor (Tempus) is installed as the catch-all application for file types that aren't specified otherwise, so dclicking on a .C, .S, .H, etc will fire up the editor. The Kuma-RCS is installed for .RSC files, dclicking on a .RSC takes me into that editor. The few folks who have sat and looked over my shoulder as I work have expressed surprise at how productive a programmer can be without resorting to a CLI at all.

Source record: 39851

In article <1993Mar20.022143.12670@mnemosyne.cs.du.edu> ilepore@nyx.cs.du.edu (Ian Lepore) writes:
> There is, as I see it, only one argument for continuing to use 'int' as
>a datatype in the GEM programming interface: A large mass of code exists
>already that uses it. That is a powerful argument, not to be trivialized.

That certainly is a powerful argument. There is another argument as well, though: namely that ANSI specifies that the prototype for the function:
int foo(x) short x; { ... }
is in fact
int foo(int x)
(because of the default parameter widening rules which have existed since the original K&R).

This effectively means that if you want to interface code which was written in Classic C with ANSI C code, then you'd better use ints. In fact, the compiler will force you to use ints. Whether or not this will matter will depend on the compiler and the specific details of the code. It certainly will matter if there are no prototypes in scope for functions (e.g. if the user has his/her own header files, or doesn't include header files at all).

You can avoid this problem by (a) requiring the user to always include the appropriate header files (not an unreasonable requirement), (b) providing prototypes everywhere, and (c) writing the libraries to use prototyped definitions when __STDC__ is in force, e.g.:

```
#ifdef __STDC__
int foo(short c)
#else
int foo(c) short c;
#endif
{ /* body of foo goes here */ }
```

The last requirement is a bit of a bother; but if you don't mind it, then I would say that going with "short" is probably a good idea.

One last caveat: some supposedly ANSI C compliant compilers get this "wrong". I think earlier drafts of the ANSI standard didn't require parameter widening.

Sorry, that's completely wrong (unless he meant the automatic high
density (HD) floppy support).

>and that no damage would result from repeated disk access.

That may or may not be true - anyway, the noise is quite annoying.

>The chap I spoke to said he
>only had suspicions as to the cause of the noise; he didn't know for sure
>why it happened, but that it varied between different ST's (mine is a Mega 1)
>and different disk drives. The step rate has nothing to do with it (as I
>and others had found),

It _has_ something to do with the step rate: due to a bug in the system
initialization, the BIOS "thinks" that a HD floppy is connected and
subsequently internally doubles the actual step rate!
(In high density mode, the floppy controller is clocked with twice its
normal speed, and that must be compensated for.)

>and there is no fix (other than getting used to it!).

Fortunately, that's wrong, too. :-)

Almost a year ago, Martin Osieka (author of GEMRAM and WINX) wrote a small
program that fixes this problem; try to find SEEKUP.LZH (or SEEKUP.*) at
atari.archive.
I don't know if it's already there; if nobody objects, I could post it to
this newsgroup as a uuencoded binary (is's quite small - under 2 KB,
including C source code).

> Writing to the screen memory is as wrong as possible

OK, you write your nice portable programs that use the VDI drivers, and I'll write straight to screen memory.. We'll see whose program sells best. People in the real world like fast programs. If someone else can write it faster, their program will sell.

Screen redraw is one of the most expensive parts of many programs, so if you're going to do any assembler this is one of the most effective place to do it.

And if you wanna make the code work on different machines, they just include the specific code for each machine. There's not much problem with that.

btw. you ought not to tell people "they are as wrong as possible"

Is there an easier way to transfer values from variables in memory into their appropriate spots in a dialog box than by manually, individualy setting each and every object? I don't know if this came across understandably...basically I don't want to have to have COUNTLESS lines of:

```
nice_dialog[OK]^.ob_state:=NORMAL; {Oh, this is pascal, BTW}
nice_dialog[CANCEL]^.ob_state:=NORMAL;
.
. {a million other buttons}
.
nice_dialog[EDITFIEL]^.ob_spec^.te_ptext^:=' Default value ';
.
. {a zillion more editable fields}
.
...
```

Likewise, is there an easier way to read the changes that were made by the dialog and to update the proper variables?

Would I be better off trying to change all my dialog code into 'dialog in a window: doesn't-freeze-up-the-system' type deal? Do I manually call a wind_update(beg_update) when I use the afformentioned 'fake' dialog box? Is it the wind_update that freezes GEM (ie, not letting STalker do it's downloading in the background) or is it something that ONLY occurs with FORM_DO?

Thanks a million for any help!

> strip
> prgflags
>
>If a person would kinding help me out with these files, I'll post my
>instructions.

Three comments:

a) Version 1.04 is now at atari.archive. You haven't got 0.99
running, yet, and 1.04 is already available :-(.

b) Concerning "strip";

This step of the processing is somewhat optional. I gather that "strip"
just moves stuff around in the object file, removing some extra
labels. Unless you're planning on running a debugger on MINT.PRG
(which I would speculate is a BAD IDEA in any case), it's not REALLY
necessary to "strip" it.

However, my copy is stripped, and you likely have the appropriate
program: --> xstrip.ttp

It's part of the GNU compiler utilities. The GNU edition is called
xstrip.

c) prgflags

Only necessary on a TT or a Falcon; this sets some sort of
68030-specific "fast-load" bit.

The argument of "7" looks to me very much like it's not much more than
the use of some equivalent to chmod.

You very probably don't need prgflags. Comment out/remove the line in
the makefile.

By the way, version 1.04 has been running here since about 1:30 pm,
and hasn't crashed so far (I haven't done much - it's mostly been
idling all afternoon/evening, but it's still a good indication!)

Thanks again, Eric!

> using typedef'd type WORD in GEM programming

I considered that as a solution, but the sad fact is, WORD means
different things to different folks. One PORTAB.H file I've seen
typedef's WORD as int, supposedly as a way of providing compiler
independence. Some independence! (Besides that, a word is actually
different sizes on different chips/machines, so it seems a marginal choice
for a size-independent typedef.)

If I had gone that way, I was thinking of using GWORD (GEM WORD) as the
type. But it struck me that this would require just as much mass
conversion of code as just using short as the type. And I've never heard
of any compiler on any system that had a size of other than 16 bits for
short. (I still prefer the old FORTRAN method of INTEGER*2, INTEGER*4,
etc. At least you know exactly what you're getting that way.)

```
> You can avoid this problem by (a) requiring the user to always include
> the appropriate header files (not an unreasonable requirement),
> (b) providing prototypes everywhere, and (c) writing the libraries
> to use prototyped definitions when __STDC__ is in force, e.g.:

I have no problem requiring the user to include the header file that
contains the prototypes. In fact, the nature of GemFast is already such
that they have to include GEMFAST.H or nothing works (because of some
macro magic). The header file contains prototypes for all public functions.

> #ifdef __STDC__
> int foo(short c)
> #else
> int foo(c) short c;
> #endif
> { /* body of foo goes here */ }

I'm already using that technique in the library internals, where needed.
I have found that

int foo(short c); // in a header file

int foo(c) short c; {} // implementation that includes the header file

Works just fine. At least on 6 compilers I use now it does. I wouldn't
be overly surprised if some fine-print in the ANSI spec was taken
overly-litterally by the GCC authors, making this technique fail; guess I'd
better investigate to be sure. (I've already found another situation like
this, involving structure tags in prototypes, where GNU takes a very
literal implementation of the ANSI spec, and the other 6 compilers I use
have choosen to implement it in a way that's usable as opposed to pedantic.)

I've got GemFast up and running under GCC now, with the limitation that
you have to use the -mshort option (because of the way the GCC GEM
bindings are written) and extensive (but not exhaustive) testing has been
successful so far.

I'm probably gonna have to do a custom version of the bindings to get it
to work without -mshort.

And then there's the question/problem of what to do about evnt_timer().
DRI defines it as taking two short parms, but the GCC GEM bindings have it
taking a single longword. I don't know what would lead someone to change
the parameters of a well-defined and documented function to something
other than what the rest of the world uses, but there it is, to be dealt
with. (I disagree with some of the DRI-defined bindings too, but when
I've defined new "more sensible" bindings, I've given them slightly-
```

different names, eg, evnt_multi() takes a zillion parms, but my
evnx_multi() takes just one.)

1557. menu_popup() and gemlib

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-22 06:21:35 UTC
From: erlingh@storlind.idt.unit.no
Message-ID: <ERLINGH.93Mar22062135@storlind.idt.unit.no>
Source record: 39862

Hi.

Has anybody actually tried to use the new menu_popup() call from
the new gemlib (+gcc 2.3.3) ?
I have. With no success. And - oh I _am_ running multitos, which supports
the new calls.

At first, I made my own little library/include files,
aes4.h + aes4.olb, and everything was working just fine.
Then, as the new gemlib came along, I thought I'd might as well use
that. But no. As soon as the menu_popup call is performed, the machine
just hangs. And the really strange part is that the code for both the
call and the associated structures (MENU *), is identicall in my
version and the one in the new gemlib.
I couldn't see anything else in the diffs that could influnce this either.

Anybody got a clue ?

Erling

Do those 6 compilers claim to be ANSI compliant? If so, they're mistaken.
From the comp.lang.c FAQ file:

5.6: My ANSI compiler complains about a mismatch when it sees

```
extern int func(float);

int func(x)
float x;
{...
```

A: You have mixed the new-style prototype declaration
"extern int func(float);" with the old-style definition
"int func(x) float x;". Old C (and ANSI C, in the absence of
prototypes, and in variable-length argument lists) "widens"
certain arguments when they are passed to functions. floats
are promoted to double, and characters and short integers are
promoted to integers. (The values are automatically coerced
back to the corresponding narrower types within the body of the
called function, if they are declared that way there.)

The problem can be fixed either by using new-style syntax
consistently in the definition:

```
int func(float x) { ... }
```

or by changing the new-style prototype declaration to match the
old-style definition:

```
extern int func(double);
```

(In this case, it would be clearest to change the old-style
definition to use double as well, as long as the address of that
parameter is not taken.)

It may also be safer to avoid "narrow" (char, short int, and float) function arguments and return types.

If you're looking for ease of compile, use gcc. It's the "canonical"
compiler for MiNT, i.e. the one I use. That's not to say that HSC 1.40
wouldn't work; but it may require some tweaking, since it's been a long
time since I've used any non-ANSI compiler to build MiNT (or is HSC
now ANSI compliant? I haven't looked at it for a while).

If you don't have gcc (and don't want to get it), Pure C and Lattice C have
also been used to build MiNT. Julian Reschke recently announced the
availability of his patches for MiNT 1.04 to make it build with Pure C.
Most likely those patches would also make Lattice C work fine, too. (They
fixed a few places where I let gcc'isms slip through.)

That's correct. As far as I know, it's impossible to exit cleanly from GEM
(once it's installed, it can't be unhooked any more, and attempts to
re-install it will crash the machine).

>boring (and slow) bit logic. Sure, it would be nice to have 1 pix/byte
>for text and stuff, but FUN programs would really suffer.

Actually its the text and stuff that benefits from bitplanes since its easy
to write fast code that is independent of the number of bit planes. Its
3D apps/games that really suffer - here you compute the numerical value of
a pixel and have to write each bit to a seperate word.

Having eight layers of single colored sprites isn't much good any way;
and the bit logic for multicolored software sprites
can be done really fast, especially with a blitter. I don't think any ST games
waste precious colors for sprite layers and I doubt that Falcon games will either
(if anybody bothers to write any).

From: steve@wan.inf.rl.ac.uk
Message-ID: <13299@hardy.rl.ac.uk>
Source record: 39874

It seems to me that either option is OK if you are going to compile with 16bit ints.
If you are going to compile with 32bit ints you are going to have inefficency any
how since shorts will be promoted to ints before being pushed on the stack.
Even on the Falcon 32bit ints will suck because of the 16bit data bus.

How about this: You design your bindings for 16bit values and declare such values
as being GEMINT in the header file. The user can then define GEMINT to be
either short or int depending his code. Of course this will break with 32bit ints
but no single set of bindings will work for both int sizes simply because
of the difference in the number of bytes pushed on the stack.

BTW If Atari are using Lattice C, presumably they are using 16bit mode???
Using 32bits with some kludgy asm to fix up the stack is to awful to contemplate.

I upgraded by STFM (1Meg) from tos 1.02 to 1.04 last year, & it was well
worth it. The speed increase in disk I/O is the best feature, along with
```

the MOVE option for files.

There are other enhancements that make it worth while, these become like second nature after a while, I've forgotten most of them.

I was concerned at first, about incompatability problems, but I have since found that programs which had problems under 1.02,were bug free under 1.04.

Basically, if you don't want tos 2.06, then get 1.04 ASAP.

I think what is needed, is a more general, GEM-aware, init facility.
The current setup does (to my haven't-looked-at-source-yet knowledge)
only support either running with the init/login/logout scenario or
trapping into the gem-scenario. Part of the problem is that when init
runs and starts thing up, this happens *before* gem is started.

The problem is that starting gem is a pretty heavy thing to do,
because gem comes with its own `shell', the desktop. So, if GEM should
be started up, either you must accept to start init by hand (ie. by
double clicking on init.prg, or some equivalent), or you must make
some sort of accessory, which GEM loads automatically on startup. This
may have some subtle complications making it impossible, I don't much
about it, but at least that would be the general idea.

The present way of starting GEM (gem.prg/bootgem.prg) does not start
GEM as process that will later terminate, but sort of continues the
startup procedure.

There are, I think, several ways round this, or at least faking the
situation. The easiest would perhaps be to wait for multiTos. This may
(or may not) solve the problem.

One could perhaps also make some sort of geminit, that first starts gem, but
not the desktop (if that is possible), displaying a dialog box for
login, starting an apropriate shell, reclaiming control when the shell
exits in the usual manner. But then you would loose the desktop.

If you do not have you system running for long periods of time, giving
that usually only one user is active during a session, you could use
the standard init procedure, giving some of the users bootgem as

startup shell. Then you can have one account for UNIX hacking (using bootgem when you need GEM) and another account when doeing graphics. But you still can't get back to the login prompt later. The situation is somewhat remedied, if you has the su program. Then you can switch identity at any time, without the need for relogin.

Finally one could make an intelligent logout program, that would be able to reenable the init process, which still should be there, after GEM has been started, giving the best of all worlds. The bootgem program should then be protected against being run again, in some way, but that shouldn't be so hard.

The above are pretty basic ideas, and some require some guru insight to determine how (and whether) to do it. But it should be possible to go some of the way.

153600 baud. But you'll need special software supporting this speed.
So far I think only my terms program CoNnect is able to support higher
rates than 19200 baud (38400, 57600, ...) on the falcon.

There is another reason to use int instead of short: On pre-ANSI C
compilers (is there any pre-ANSI 32 bit ST C compiler?) all short
arguments to functions are cast to int's (by sign extending). This gives
an overhead on using short instead of int. (Testing this revealed that
gcc 1.40, on a sun 3, does this casting as well.)

>wastes memory and CPU cycles. It also imposes artificial limits on the

>in the average program.

The fact you chose to use pre-allocated arrays is an implementation detail.
You don't have to! (Using alloca coemes to mind.)

>unusual. And I don't think it's even wrong.)

This should not give problems, as both the GRECT, as the PARMBLK and
ICONBLK should have int values, instead on shorts.

> If the elements within a GRECT are defined as shorts, this doesn't create
>any problems. When the elements are defined as ints, problems arise when
>the compiler uses 32-bit ints.

I don't understand -- in the PARMBLK are int's as well?

From: grw@ukc.ac.uk
Message-ID: <7029@falcon.ukc.ac.uk>
Source record: 39878

Has anybody successfully patched GDB to version 3.5? The necessary diffs
were uploaded the other week to comp.sys.atari.sources but I managed to lose
my copy of them (stupid mistake when downloading them onto floppy!)

So if anyone has the diffs that they could mail me I would be eternally grateful
or maybe point me in the correct direction for the binaries (saved me waiting
hours for GCC to compile it on my lowly STe!)

(By the way, could you reply by mail, since I won't be reading the net for a
few weeks)

cheers,

I wonder if a GFA expert could answer a few queries:

1) Is there a PD 'run-time interpreter available for GFA 3?
(ie like the GFABASRO.PRG that can run GFA 2 non-compiled programs)

2) If not is there a PD tutorial for GFA 2?, similar to GFAXPERT.LZH for GFA 3
from Han Kempen.

3) Is there an FTP site that specialises in GFA?

4) Lastly (sorry if this is a FAQ) - how do I read the joystick in GFA 2?

TIA

TOS 4.01 is a dog. It's slow & unweildy. There are two ways to speed things up. One is to use ROMSPEED.PRG which copies the ROM into RAM & speeds things by approx 10%, or (as I have) get a bootable version of TOS 4.02, which is a fair bit faster. This is the OS which will be in the main release Falcons (RSN - honest).

Something has happened to MultiTOS between last Junes Developer release & the release which came with MiNT v1.0 (which by the way doesn't work as well or as fast as the freely available MiNT v0.99 - use that instead). The whole system has almost halved in speed in the intervening monthes. I don't know what they've done, but last Junes release wasn't as pretty but was much much more usable speed wise.

That said, the current release is very usable on a Falcon (I use it myself) where-as last Junes release won't run at all on the F030 ?????

The 256 Colour mode redraw isn't as bad as was made out, but True Colour mode update is a nightmare.....

Source record: 39887

Sorry for posting this, but two email attempts to Georg have failed.

==========

Hello Georg,

I am very interested in your post to comp.sys.atari.st.tech, concerning writing to the ROM port of the ST. I (and most others) have thought it impossible, due to the bus error you mention. I should be very grateful for some more details of your scheme to avoid this problem, since I wish to interface some DSP chips to my ST - I was contemplating having to pull the 68000 out of the board, and mount it on a daughter board, with my DSP's mapped immediately above the 4Meg top of RAM. This would require lots of glue logic, and a DTACK generator, and would also mean that the ST no longer fitted its case. If however, I could make the ROM port bi-directional, this would be a *very* neat solution, since the DSP's would be external to the machine.

As I understand it, if you detect an access to the ROM area, you effectively disconnect the CPU R/W* line from the glue chip (holding the glue input high).

Many thanks in advance for any information you can give me.

A> Can anyone advise me on a decent 17 inch mointor for the falcon. I
A> want one that can cope with overscan, and hopefully custom modes..

Well, the problem with low-cost 17'' monitors is, that the position of the screen changes when you switch resolution, because the frequency changes. (you won't die from it, but it most certainly is annoying ;-) So you'll have to have a monitor which remembers where to put the screen when a certain frequency occurs. Eizo, Viewsonic, Nec, etc. have such monitors, but they are not cheap...

Well, Lines isn't a representative program if you look at real life
situations. It does a lot on the screen, spend most of it's time in VDI
code, which does take alot of time. Most programs don't do that much of
screen output. And btw. every program which does a lot of screen output
slows down a multitasking operating system considerably. Not only
MultiTos...

RP> befor the window was activated. This was in ST High resolution.

Because Lines spends alot of time in VDI code and messages can get lost...

RP> MultiTOS version was, I think, 1.0. If it really would be this bad,
RP> why hasn't anybody complained? Maybe it was something with the setup

Because normally, you don't get that much of a slowdown. I do all my
programming under MultiTos. I run Alert, XControl, MiNT Control, Pure C,
7Up (an editor which I use to read the MiNT documentation), TosWin, Console
and TCSH (a CLI). You could call this a `real life situation' and MultiTos
runs smoothly and I can program without haveing the feeling that the system
has slowed down. This is because all these applications are mostly waiting
for some input from the user. When compiling a program (eg MiNT ;-) usening
GNU, which does a lot of memory access and stuff, the slowdown is
noticeable, but bearable. I can still continue to work with other
applications. The only time it becomes nearly unbearable is when there's a
lot of disk access, but that's the case with almost all multitasking OS.

RP> or something, old versions of the OS perhaps? What factors influence
RP> the speed (besides multitasking)? There were about 30 fonts and

As I said, hard disk access and lots of screen output are the main causes
of slowdown. It also depends how programs were witten. Binkley (FidoNet
mailer) slows the system down tremendously, probably because it
continiously checks the modem port. If it would have been written
differently, the slowdown would have been much smaller.

Greetings... - Jan -

My motherboard looked like this:

W203 W201

```
-----------------
|
|
-
| LO
-
|
|
```

W202

and to get the "ABAB" combination as mentioned above, I had...

W203: pin 2&3
W201: pin 1&2
W202: pin 2&3

Try looking up under TOS 2.05 in the same book, as this was what I
originally had, and, according to HackBear, when he got his 2.06, he
got a new motherboard.

> I would also like to point out that all versions of the operating

1580. More MDK stuff

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-22 14:11:39 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <1993Mar22.141139.20660@sol.ctr.columbia.edu>
Source record: 39890

Hi people,

Ok - some more subsets have been added to the base distribution kit.
These (in no particular order) are:

bgcc233p2.zoo:
The latest version of gcc for mint - includes the -mbaserel,
-mpcrel options for creating shared-text programs.

Gawk.zoo:
This is GNU awk. Awk is a text processing language on Un*x
systems that allows the processing of any text file or
program output in a very flexible manner. This is required
for the find subset if you wish to use the 'locate' shell
script. (Note: the find subset is not yet available - RSN!)

Cat2.zoo:
cat.zoo contains a version of cat lifted from the bsd sources.
If you were to try something like:

cat > file
... with the cat command included in the original mdk,
you'll find it gives you a 'bad memory block' or somesuch
error. This one has been working fine for some time on my
system, so here it is :-)

G++233.zoo:
This is (for a change) the g++ cross compiler. Actually it is
the cc1+ back end, you'll need the gcc233 subset to make this
work. Note that g++233 cannot create shared-text versions of
programs.

Tar1111.zoo:
tar here is GNU tar 1.11.1. I intend to migrate the MDK to use
this and gzip rather than zoo because the program does not
reduce filenames to 8+3 and distinguishes between UPPER and
lower case.
(It is the latter point that is stopping the general
distribution of groff. All the font names are upper case -
which would work on a TOS fs, but not on minixfs. I hope to
rectify this soon)
With the above in mind it would be 'adviseable' (read:
probably compulsory :-) to install this subset. I will keep
INSTALL backwardly compatible, but the future subsets will
probably be in .tar.z format (or .tz on tosfs).

UUutil.zoo:
uu.zoo contains two programs uudecode and uuencode, which
convert 8-bit binary data into a textual form that can be
mailed to people. Useful to those who haven't got sz/rz on
their un*x systems at college/work but *need* that file
tonight...

That's more or less all. The find-3.7 subset turned out not to have
been zoo-ed properly, so I'll deal with that tonight/tomorrow.

As mentioned above, I've now got groff working, and I have both tcsh
and sh scripts that create a useful 'man' command. I'll create a
subset containing all this in the near future - I have to get INSTALL
to work with .tar.z files as well as .zoo files first.

Interestingly enough, it is tcsh which is by far the faster of the
two 'man' scripts. Possibly my inept sh programming, I suppose, but
I always thought sh was an efficient script language...

Simon.

Well, I have been useing it on a TT for almost half a year now and I love it. And I believe that the TT is a minimum where serious multitasking is concerned. Look at other systems. Windows needs at least 486SX25 or 386DX40 to make it useable. Useing X-Windows requires a 32 Mhz machine to do it pleasantly and idem where System 7 is concerned. Useable multitasking simply can't be done on slow machines. You need a minimum amount of power, because of all the overhead. This simply is a fact. I am convinced that the net's population, once MultiTos will be widely available, will complain that it can't used normally on STs, Mega STs and Falcons and blame it on MultiTos. MultiTos isn't a bad, slow, inefficient program in my opinion. But you just shouldn't expect of it what simply can not be done. The Falcon is a wonderful machine, but multitasking on it probably asks a bit too much of the system.

CB> Mhz.

To my feeling, the early releases ran faster than the newer ones. (that is up to MiNT 0.99) Now I have compiled MiNT 1.04 useing GNU to create 68030 code and it runs faster than ever before... :-)

CB> Either that, or GCC, which I used to compile MiNT, does FAR better
CB> optimization than Lattice C (which is what Atari is using to
CB> compile MultiTOS). In which case Atari probably ought to change

If I'm not mistaken, Eric Smith is useing GNU. The PD sources of MiNT 1.04 are prepared for GNU and with some adjustments you can compile them with Pure C and Lattice. What the rest of the TOS team are useing, I don't know, but I guess GNU generates very good code, it being constantly optimized on universities and such...

It's currently 31 pounds for 12 issues worldwide Air Mail, so about $45. Still pretty steep though, I agree. You could always order a couple of back issues to try it out first (about $3 each + P&P). The overseas distrubutors, "Worldwide Magazines" have a Canadian office too, which should be cheaper than direct air mail (tel; 519 539 0200 fax: 519 539 9725).

Incidentally, there's a claim that Dave Small is to launch his latest Apple emulator at the CeBit show on the News page of April's 'Applications: "It's designed for the Falcon and is rumoured to be able to emulate a Quadra, but at a higher speed than the Quadra can emulate itself". I seem to recall Dave himself denying any such speculation on this newgroup a while back tho'.

There's a nice anecdote that Apple's system software now has messages in it saying "Bet you can't get around this, Small" - time to move on to folklore.computers perhaps ?

Sam

Well, I just bought some second hand software. It does not run on my machine (STe, TOS 1.6) because the author used hacks to write to the screen instead of using the VDI. I have now had to write a patch program which fixes the software I just bought. I believe that the company who wrote the software are no longer in business, so how would I get them to fix it? What would I do if a simple patch was insufficient, or if I was not clued up enough to find the problem and patch it?

Well-behaved GEM programs should use the VDI for screen updates. Period.
With NVDI, TurboST etc, the VDI is usually almost as quick as you will get, if used carefully.

[Perhaps Atari should have hired the authors of NVDI to rewrite the low-level graphics in the new ROMs?]

A lot of tweaking, probably. I haven't had time to try building MiNT
with HSC yet (I can't wait till summer, when I get my free time back!),
but based on my experiences with the MiNTlibs, the main things you'll
likely have to watch for are implicit sizeof(int)==4 assumptions and
long symbol names (HSC 2.0, at least, will alleviate the latter
problem).

In 'The C Programming Language' Kernighan & Ritchie state:
"The intent is that short and long should provide different lengths of
integers where practical; int will normally reflect the most "natural"
size for a particular machine. As you can see, each compiler is free to
interpret short and long as appropriate for its own hardware. About all
you should count on is that short is no longer than long."

Although the Laser compiler, linker, make, and other utilities will
run under a command shell, extended arguments will not be supported
because Megamax implemented their own standard. It is unfortunate
that Megamax stopped suporting Laser C before Atari sanctioned the
ARGV protocol for extended arguments.

>
A rather long piece on the relative worth of using the short and int keywords, so I thought I'd put my point of view :-)

I have for quite a long time used the HITECH C compiler for TOS which uses 32 bit ints. And the DOS GEM 3 deveolpers info, in addition to the TOS developers kit. Personally I think the inappropriate use of int should be "Purged from the midst of the assembly" The method of doing this should be portable to all C implementations even those future versions with 64 bit ints and 32 bit shorts !!!!!

The Hitech method for argument compatibility is to use a typedef for all gem short arguments (ie most of them :-)

typedef short WORD;

From memory the GEM 3 doco uses WORD size rather than int OR short. Existing programs, library sources and header files should be converted to use the new WORD type, thus now it is a matter of changing one line to make all gem codes compatible to all architectures and compilers. Personally to compile 16 bit int codes I have used the cc -Dint=short method of conversion which works most of the time.

To summarize using both the built in types int _OR_ short is unacceptable

Does this mean I am starting a NEW religion ???

BOB
R.Lunnon@qut.edu.au

ps: maybe WORD is bad and perhaps it should be gemint_t or something ...

Although it pains me to have to say it, I would be quite amazed if HSC could compile MiNT. I've never seen the MiNT source, but surely it is full of advanced code constructs and techiques, and most of all, prototypes. HSC is still a K&R/Classic C compiler.

Although I continue to support HSC, I don't actually use it much myself anymore, I've moved on to Lattice C. HSC is still a good choice for folks who can't afford the $200+ Lattice package, and don't have the megabytes of hard disk and memory required to run GNU C.

>This should not give problems, as both the GRECT, as the PARMBLK and
>ICONBLK should have int values, instead on shorts.

In this case, you absolutely cannot define the elements of the PARMBLK
and ICONBLK structures as int types on a compiler that supports 32-bit
ints. In the case of the PARMBLK especially, that is a structure that the
AES is filling in and passing to your function, and you have no control
over the size of the elements. With the ICONBLK, it is a structure which
the AES reads, and it expects 16-bit values in it. These are not items
where cleverly-designed bindings can do translations for you.

First complaints I've heard of this type about Laser's editor. Personally, I think you're both on drugs. 8^} The editor has its problems, like forcing you to constantly switch between the keyboard and mouse, but it's fast, clean, nicely implemented, and very bug free, something I would not claim about Gulam and its ue. And what's wrong with the file selector? Sheesh. So it's different than the gem one, so what. A lot of their UI stuff is based on Mac conventions, like lighting the scroll arrows when you click them, which I like a lot. Also, they had to write their own scroll lists in order to allow multiple selection, which is one huge drawback of the gem file selector. I dunno, for a GEM editor, I think the Laser shell is great. Would all the Laser shell environment variable stuff work under Gulam? Are their make files compatible with some other make (GNU make perhaps)?

1596. Ringing SM124

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-22 18:49:55 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Mar22.184955.4212@ultb.isc.rit.edu>
Source record: 39753

I have a problem with my SM124. Sometimes, at random, the monitor slowly makes a high pitched, sort of sinewave type sound that either is medium loud or slowly gets louder from an almost inaudble level. It sometimes happens often and then sometimes doesn't occur for long streaches.

To cure it, sometimes I can whack it on the back or the side and this will temporarily "cure" the probelm. (Needless to say, I don't like doing this!) Also, the ringing will stop completely if the monitor is turned 90 degrees to the right but when I turn it back, the ringing comes back.

At first I thought it was the monitor resonating with the fan in the computer's power supply but if I move the monitor or shut off the computer, it still rings.

The ringing seems to occur when the screen contains mostly white (on) pixels.

I'm using it with a MEGA/STe. I bought it used and it looks like it's really one of the FIRST SM124's ever built! Very old styling. Not like the SC1224 (which I bought around 86) that I have. The SM124 I have looks more like one of the '84-'85 models (remeber the JVC SC1224's? from LOOOOOONG ago?)

Somebody said that it was the Flyback transformer that was ringing but I would like to know if it's anything else. I've heard that early SM124's had some problems. Any suggestions?

Thanks!

1597. Writing MiNT XFS : Help needed with memory management

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-22 19:08:24 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms.732827304@radon.sys.uea.ac.uk>
Source record: 39750

I'm trying to write a ramdisk as a MiNT XFS and keep having problems with memory allocation/deallocaton.

I have two versions: a static and a dynamic

The static version simply allocates one block of memory and manages that itself. The code for that works pretty much like the standard malloc from the MiNTlibs. However it never seems to recombine contiguous free blocks... this may be my code

The more serious problem (the one I really want sorting out) is with the dynamic version. I've got it all working fairly nicely now apart from deallocating memory. I make the necessary kfree calls via the kernel structure but no memory ever seems to be freed. I guess this is due to the internal memory management of the kernel with blocks being tied up by having parts of them used by other processes. However I wouldn't expect this to be as severe as it seems... if I copy lots of things onto RAMdisk, say 4MB, and then delete all the files, I do not recover a single byte of memory...

Anybody got any ideas... I'm really stumped by this.

-Steve Sowerby (sms@sys.uea.ac.uk)

It seems to me that the sentence in parentheses is the functional one here. I'm not in a situation of mixing C and assembler code or anything like that here; I'm dealing with C only. I have prototypes in scope for each function which declare the parameters as short. I have Classic C definitions of those functions in the presence of the prototypes. I am not getting warnings about argument type mismatches, not even from GNU C. And that sentence above confirms that within the body of the functions, the parameters are being accessed as defined in the old-style function headers (which matches exactly with the prototypes). It doesn't matter to me what the compiler has actually put on the stack or in registers as part of it's call/return mechanism, as long as the functions behave consistantly with how I prototyped and defined them.

Perhaps if I used whatever "strict ANSI" compiler options each of my compilers provides, it would warn about these things. I never use such options, because what's the point of using a compiler replete with usability extensions if you just disable them all?

Anyway, all of this isn't really a part of the basic issue at hand: how to define the interface to GEM, with shorts or with ints? If I have to put #ifdef __STDC__ wrappers around every function definition within the library internals, that's just an implementation detail for me to worry about.

>TOS 4.01 is a dog. It's slow & unweildy. There are two ways to speed things up.
>One is to use ROMSPEED.PRG which copies the ROM into RAM & speeds things by approx
>10%, or (as I have) get a bootable version of TOS 4.02, which is a fair bit
>faster. This is the OS which will be in the main release Falcons (RSN - honest).

Thats why the 4.03 have been available for developers for a couple of weeks now?
Remember the TT? The 3.01 was wery soon replaced by the 3.03 which again were
quicly replaced by the......
PS. If you have a 'legaly' obtained 4.02 you should be able to obtain 4.03
from your source.

>Something has happened to MultiTOS between last Junes Developer release & the
>release which came with MiNT v1.0 (which by the way doesn't work as well or as
>fast as the freely available MiNT v0.99 - use that instead). The whole system
>has almost halved in speed in the intervening monthes. I don't know what
>they've done, but last Junes release wasn't as pretty but was much much more
>usable speed wise.

And V1.0 locked up a lot more definatly when a memory protection violation
occured. Anyway, they ARE (were) working on these problems. A lot of
betatesters are doing a good job finding bugs, so when the public finaly
gets MTOS, there shouldn't be much bugs in it (I hope)!
There have also recently been added som nice features to the GEM/AES that
makes the upgrade to MTOS (or F030) worth whatewer they decide to charge
for it.

(I do not have a falcon (due to lack of funds:) so I can't coment on the
performance of MTOS on the bird!)

(report from one of the lucky betatesters of MTOS & SPEEDO)

>stripping the control characters out!

There are no control characters in TeX files. Control characters are non-
printing ASCII characters. This is a typical section of TeX documentation:

```
------------------------------------------------------------------------------

\section{Introduction}
I am creating a new window-port of NetHack 3.1 using the new
window-port interface. As part of this process, I am documenting
my experiences with the interface.

\section{Positives}
I once before thought about porting NetHack to have a graphical
display (after successfully giving a GUI to GNU Chess and GNU Go).
However, the huge numbers of I/O functions quickly discouraged me.

However, as soon as I saw the window-port documentation,
I immediately proceeded. Excellent results followed. The most impressive
features of the window-port interface are:

....

------------------------------------------------------------------------------
```

TeX (Well, LaTeX actually) is great.

```

> Minix file system.
Psetuid/Psetgid work fine.

>- pass all USER and HOME variables to the TOSWIN shells (BASH, TCSH, KSH,
etc.)
> so that these program work correctly
This is already done today.

>- when I log out (I don't know how to do this in GEM) I go back to the
> command prompt.
This will be hard work. GEM isn't what i call a 'clean' program. It hooks
in lots of vectors, and i'm not sure whether it uses Setexc or not.
A hypothetical /bin/logout would have to kill GEM and all GEM-programs,
and must restore all vectors (if they were not set with setexc).
Indeed the real problem is to kill the GEM-programs. You must kill them
before GEM is killed (or they'll crash), but you must not kill them 'cause
GEM doesn't like that. Perhaps entering supervisormode will help a little
since this blocks taskswitches (which could only cause trouble), but this
behaviour is undocumented and may vanish some day.
Ah - if you do it: Please don't put the code into /bin/logout. The program
which starts GEM (oder bootgem) would be the better place because this
could be usefull if GEM is killed one other ways. /bin/logout should only
send a signal to the program which will do the cleanup.

You should use Sysmon to find out which vectors are used by GEM and how
this is done. Then you should write the vector-cleanup. Only if this works
if no ACC or APP is running you should do the next step.

>Can anyone give me some suggestions. Simon Gornall has already given me
>some hints, but his information was mainly that I will have some trouble
>with the exiting of GEM.
"Some" trouble? Friends of mine tried to deinstall Ramtos and failed
(but they hadn't got the docs available today).

>How would I go about writing a "/bin/logout" program to exit GEM and go

What if I wrote a gem program called logout. That program would
call up a program that disables the pull down menus and waits
for a person to enter their user id and password.

Logout would have to kill the forground processes with the kill
command. Then it would have to somehow kill the shells under
TOSWIN.

After the user id and password were entered, I could call up
su from my program and set the user ID. Then after the USER id
and shell variables were set to the values in "/etc/passwd", the
program would have to call upon some routine to start the toswin
program with the proper shell. I seem to recall that the toswin
distribution code has example code to do this.

Source record: 39758

```
>> TeX files contain control characters
> No they don't, they're plain ascii
> [example of some very simple TeX stuff]

Your example was, IMHO, a bit disingenuous. If instead of "control
characters" you subsitute "control sequences" the original statement is
perfectly accurate. Then if we take, instead of the simlest possible example,
a real-life example (in this case, a snippet from some GCC docs, the
subject in question in the original message), you see:

@example
gcc-ar @var{option} [@var{position}] @var{library} [@var{module}]
@end example

The @var{option} specifies the action to be taken on the @var{library}
or a @var{module} of that @var{library}. @var{option} also includes
modifiers for the action. The optional @var{position} argument is a
member of the @var{library}. It is used, to mark a specific position in
the @var{library}; an @samp{add} operation would than place a new module
before or after that @var{position}. The next argument specifies the
library. The recommended naming convention for the creation of a new
libraries is @file{@var{library}.olb}. If you don't use this convention,
the compiler driver @file{gcc.ttp} will have trouble finding them.
@var{module} is usually an object code file generated by the compiler.

I think it's clear that the original point is accurate: TeX docs,
unprocessed, can be very hard to read. (Luckily I was able to glean the
info I needed from this snipped a few days back, with some difficulty.
Probably because I have years of experience reading and writing DCF/SCRIPT
documents, which use a similar style of embedded control sequences.)

Source record: 39777

I will gladly go into the 1.2 to 1.4 upgrade for you.
I will also mention that for $65.00 you can have tos 2.06.

Anyhow... I spent $90 for tos 1.4, and would rather spend $60 for tos 2.06

I liked the improved disk access routines... and some other goodies now
forgotten. Ah... 32M HD partitions...
FatSpeed built in
Pinhed built in

Those were the biggies. The last two you can immitate by using PinHead and
FatSpeed in your HD's auto folder. The 32MB partitions can be done as BGM
partitions. But it's nice to kiss the HD handler patches goodbye.

That's about it... There ARE other features.... but since I prefer UIS to
even tos 1.4's improved fileselector... I'll skip that one. And a rainbow
colored fuji doesn't look like much in monochrome (which I prefer) so I won't
mention that either.

Hummm... OK. Here's a good one! You can now use the Install Application
w/o resorting to editing your desktop.inf file!!! YES!!! Install application
really works!!!

Okay... I quit. I hope someone will mention more features!

On (some ?) transputer C compilers short is 32 bit (as is int, and long).
And i believe there exist cray compilers with char, short, int and long
all 64 bit. (These machines must have severe difficulty accessing smaller
entities as the 'natural wordsize'.)

>etc. At least you know exactly what you're getting that way.)

Why not typedef to int16 and int32?

That sounds kinda silly to me. Of course it's logical to make a long 64-bit if
the CPU can handle such numbers efficiently but what's the use of making
ALL types 64-bit? Why not make char 8-bit, short 16-bit and int 32-bit?
That way you have it all...

>>etc. At least you know exactly what you're getting that way.)
>Why not typedef to int16 and int32?

That helps but it still isn't the way it should be. You'll stil have to change
the typedefs whenever you port something. The best solution would be to extend
C with something like they have in Pascal: ranges.
For example "int:16" would declare an integer of _at least_ 16 bits.
This is not my idea, I read it in some Dr. Dobbs Journal last year and I
think it's a good idea.

I have rapidly been coming to the conclusion that in addition to XBRA, TSR
programs should uses Cookies too for vector dechaining. The Cookie could
point to say an array of three longwords (current, active, bypassed).
The 'current' vector would be the one called by the TSR and 'active' and
'bypassed' would be the two alternatives for switching the TSR on and off.
It would probably be wise to insist that the switch be done in supervisor
mode at IPL #7.
I think the use of vectors rather than flags would be more general and
allow some hooking too (preferably for patching and enhancment and not by
some virus!).

Perhaps a standard cookie name convention could be created for this usage.
As a first attempt I suggest the first three letters of the normal cookie
with the fourth a '*'.

Whadaya think?

h>
h>That's correct. As far as I know, it's impossible to exit cleanly from GEM
h>(once it's installed, it can't be unhooked any more, and attempts to
h>re-install it will crash the machine).

I had a similar problem the other day. I had created two different working environments, one using GEM sitting on MiNT (works fine), and another one using MiNT/INIT without GEM (works fine too, including an external terminal via RS232). In a second step, I tried to marry these two environments, booting MiNT/GEM and running INIT in a TOSWIN window.

Sad to say, this caused a rather confusing behaviour of the whole system:

1. The INIT login/password promts appeared somewhere on the desktop, happily ignoring the TOSWIN window I had offered them. In contrast, the messages about 'skipping disk checks', 'quick reboot' and 'starting daemons' were displayed correctly in that window.

2. I wasn't able to log in. I got one of two messages: either 'login incorrect' or 'timeout after 60 seconds', although I did certainly _not_ wait so long. (But then, the terminal did. These answers came only very slow, however, they were correctly displayed in the INIT window.)

3. Since I use GEMINI as my desktop replacement, I thought it would be a good idea to play around with its console window. Well, I found even more confusion here: MUPFEL wasn't able to run any program, probably because it didn't get all the characters I typed in. Trying to run ps e.g. I got messages like 'p not found' or 'psp not found'. (Maybe this is because the whole system slows down heavily, I couldn't find out. The same maybe true for the delay mentioned under 2.)

All this was mixed with
some INIT/LOGIN prompts and messages, i.e. 'Login:', 'Password:' or 'Login incorrect', however there seemed to be no logical connection between what I typed and what I got.

4. I could start programs like ps or top in a second TOSWIN window, no problem. But any GEM program I tried to run from the desktop refused to work. Those programs seemed to start correctly at first, showing there name in the top line of a grey GEM screen (i.e. quite normal), but were terminated immediately after that. But no bombs, no locking up the computer.

5. Surprisingly, during all those annoying things the external terminal worked fine, except for one thing: when I logged in as root, the cwd was '/dev/d/' (which is a workaround for D:\ in MiNT, as far as I remember) (D:\ is the partition where all my UN*X-like stuff is located) instead of '/'. Executing a cd command caused the next pwd command to claim it was in '/', which should be U:\, but that was wrong. I still was in D:\, as I saw with a simple ls command. On the other hand, when I logged in as ahf (which I defined as my user name in passwd, everything seemed to work all right, although I didn't test this very much in my confusion...

Finally, I must admit that I haven't the faintest idea of what went wrong :-(Any suggestions? Has anybody tried before to run INIT in a TOSWIN window? Any help welcome!!! (If there isn't much general interest in this problem, you can send me email instead of follwups, I can post a short summary here or send the answers via email to whoever is interested. Just send me a short note.)

> ... looking for a accstart.o or wahtever that I can
>link into code so it can be laucnhed as an accessory.

Add this to your code and start it either as ACC or as PRG. As far as I know
the rest of the work will be done by crt0.o:

```
/* Gcc convention for accessories */
char _stack_heap[0x8000]; /* enter your max. heap + stack size here */
void *_heapbase = (void *)_stack_heap;
long _stksize = sizeof(_stack_heap);
```

The static data _stack_heap will be your stack and heap (aahhh!). Library
"malloc()" will take its heap from here, while TOS "Malloc()" will get memory
from the heap of the current (GEM-)process. The latter method is dangerous,
as this memory is freed when the process terminates.

Greetings,
Martin <mfg@gmd.de>

A more common name for the 'very simple TeX stuff' is LaTeX. The example Ian
gives is not.

[...stuff deleted...]

Actually, the above codes are not plain TeX, but texinfo. When it comes to reading raw documents, this may not make the world of difference, but it so happens that texinfo is (sort of) a subset of TeX, that enjoys a texinfo->info translation. The info format is not entirely `clear text', but it comes very close. It is actually a hypertext format, used intensively by GNU emacs, as the basis of its help system.

Apart for special formatting of various entities (such as keyboard sequences, file names, code fragments, variables), it also offers intelligent navigating, using cross references, menus and index'es.

If one got GNU emacs one already has the ability to not only format the document, but also to read it using all the fancy stuff with menus and cross references and indexes. But you wouldn't even need emacs as there is a texinfo suite (available from your favourite GNU site, but I hear it has been ported to the atari) containg stand alone C programs for formatting and reading texinfo/info files.

Let's not argue about the readability of TeX/LaTeX/texinfo. Its not great, with texinfo being the hardest (due to the nature of texinfo and program documentation). But I suspect that the original (TeX) example was also meant to demonstrate the difference between control codes (as in wordplus documents) and control sequences.

>about.

If i understand the discussion so far, the issue involves GCC using 32
bit ints by default, GEM using 16 bits ints in lots of cases, and a
vast number of programs developed expecting 16 bits ints.

One way to maintain both the compability of using ints and the
functionality of using 16 bits, would be to restrict the use of the
lib to 16 bits ints. This can be done by adding the -mshort option to
gcc when compiling. It is off course mans triumph over the compiler to
ompse that restiction, but it seems as an immediate compromise. I'll
bet there will even be some #defines one could test on to see if the
user remembered the restriction. Something in the style of

gem.h:

```
#ifndef MSHORT
# error You must use the -mshort option
#endif
```

>distribution code has example code to do this.

That would definitely be the easiest way around. You may even consider
implementing your logout program as an accessory.

You should however be prepared for some uid considerations, as only
root processes can kill an arbitrary process. This involves that either
your login program must be setuid root (needs minixfs), or it must be
something started up by init (which is a root process), and then using
pipes or signals for communication between the `antiinit' process
(running all the time) and the (user) logout program/accessory/process
started when the user wants to exit.

You probably also want to make sure that the bootgem program does not
try to start GEM more than once (using semaphores or lock files or
some such), so that you can use it for login shell for those users
preferring the desktop as their primary shell (if you want to go with
the basic init scheme).

Hello!

I wonder if anyone can help me?

I am looking for `A Hitchhiker's Guide to the BIOS' in any format (ascii, TeX, PostScript). I noticed that a PD place was supplying it for $2.50 so I assume that it is part of the public domain and so I do not have to buy it and that I am not breaking any `law' asking for a copy (well I hope not).

I am also interested in any other Atari technical information and would be grateful for details of sources.

advTHANXance

Stephen.

The other way round. If you want to debug, *don't* strip. Stripping removes
the symbol table, making the program file smaller.

The "fast load" bit works on all CPUs. The other two bits control memory
allocation behavior. I don't know the details since I don't own a TT ...

Greetings,

Jens.

buzy@midway.uchicago.edu has crossposted a message regarding Japanese bus. practices to many (mostly inappropriate) newsgroups. At the moment, he/she cannot recieve mail, but when he can, I provide the following hack to send to buzy@midway.uchicago.edu.

This program automatically counts the number of commas in your newsgroups: line, adds one and uses this number as the number of messages to send to you. Before you huff in anger, consider two things: 1) the number of messages sent to you is roughly* equal to the number of inappropriate crosspostings you have made, and 2) the files sent to you could easily have been several megs apiece. In the future, please determine whether the newsgroup you target is (much more than) remotely connected topic-wise. You might also read the news-group in question in order to rule out sending due to either a) having no connection whatsoever with the topic you want to discuss (I repeat: discuss) or b) having already run the topic into the ground. Note that it may take extensive searching to determine how long ago a topic has been run into the ground, and apparently eons for you to decide if that topic is connected. I strongly suggest you take this time, and more if necessary.

* algorithm for determining whether message has already been sent to you has not yet been implemented. (oops...)

>LINES.APP that made a nice pattern of coloured lines bouncing at the
>screen was fairly fast in TOS 4.01, but in MultiTOS it was sluggish
>even when it was the only application running. Executing it another

This was exactly my experience!
My TT (Mag!X + NVDI) has over 500% dialog box output speed, compared to TOS. Without NVDI and with MultiTOS it's about 80%.

>time and adding mintshell resulted in such slow action that it would
>have required nerves of steel to work at the machine for more than 2
>minutes. When you tried to select a window you had to press the mouse

I tried LINES, GEMVIEW (calculating GIFs) and a GEM based Editor. It was nearly impossible to type. The machine needed seconds for every character.

>button several times befor the window was activated. This was in ST

MultiTOS seems to "forget" clicks. I saw that, too.

>High resolution. MultiTOS version was, I think, 1.0.
>If it really would be this bad, why hasn't anybody complained? Maybe

Nobody ever used MultiTOS, except a few developers with 16 MB 32MHz TTs.

>it was something with the setup or something, old versions of the OS

I tried 4 (!) different machines:
ST
Mega STE
TT
Falcon
It was all the same.

>perhaps? What factors influence the speed (besides multitasking)?

I think MultiTOS is usable on a 32 MHz TT with a lot of TT-RAM. It's not very fast on a Falcon or TT without TT-RAM. It's impossible to use on a 8 MHz ST. But on all machines Qindex is about 70%-90% of TOS speed, but it feels much slower.

>There were about 30 fonts and SpeedoGDOS loaded, at least they took a

I did not use GDOS or fonts, I used NVDI (on a TT). It's not the time for
low level graphics output that makes it. It's the long long long reaction
time when the user uses keyboard or mouse, and it ist the CPU time itself.

>long time to load from the HD. So please folks, tell me something is
>odd here? It can't be normal that a Falcon scrolls with 16% of the
>speed that an ST scrolls, can it?

It's not odd, the Falcon with TOS 4.01 or 4.02 is quite fast, I think. It's
nice to work with it, but that's with (Single)TOS.

>cut and paste back and forth. Oops, I left some data on the
>mainframe. No problem, just load up CoNNect or Flash, and download

>it.

But why, why, why use "preemptive" multitasking then??? Why not only use cooperative multitasking ? Why use MultiTOS ?

>It's not how badly a demo can abuse the system that's important - it's >whether you can do something real with the computer or not.

I can't with MultiTOS. If I saw MultiTOS on a Falcon, I would go and buy a 50 MHz 486 and use OS/2 2.1. That's the reality.

>If i understand the discussion so far, the issue involves GCC using 32
>bit ints by default, GEM using 16 bits ints in lots of cases, and a
>vast number of programs developed expecting 16 bits ints.

Well, there are really two issues. The one you mention involves the
less-important of the two (IMO), that of efficiency in implementing the
bindings. I used this efficiciency issue to bolster my case for declaring
things as short where appropriate, and now I'm wondering if that was a
mistake, since everyone seems to be getting hung up on it.

The real issue, the one that strikes me as really important, is
portability. It isn't the size of an int that causes the portability
problem, it's the type. If the bindings are prototyped as requiring a
pointer to a short for a given data item or array of items, then you can't
pass a pointer to int. If the bindings are prototyped as requiring
pointers to int, then you can't pass pointers to short items.

Lattice C's GEM interface requires pointers to short. GCC's and
Turbo/PureC's interface requires pointers to int. (Sozobon/HSC don't care
right now because they don't support prototypes.) In a world where we
have two competing interfaces that are not compatible with each other, it
becomes more difficult to share code between programmers using different
compilers. This is an important issue to me, as a library writer, because
my libraries need to support everyone, no matter what compiler they choose.

If I write some code for Lattice C, it might contain something like this:

```
short mx, my, mb, key;

graf_mkstate(&mx, &my, &mb, &key);
```

That code won't compiler under GCC, with the -mshort option or not,
because the graf_mkstate() function under GCC's bindings expects four
pointers to int, not pointers to short.

The Hitchhiker's Guide to the BIOS is a copyrighted Atari document, available only to registered developers. At least, I've never heard anything to indicate that Atari released their rights to it to allow free public distribution (someone correct me if I'm wrong on this).

The right way to get it would be to call Gail Baccani at Atari Developer Support, but I'm pretty sure you can't get just the HHG, you have to buy the whole documentation package. Or, buy a 3rd-party book that covers the same information.

1634. Overscan with MiNT .99 or MiNT 1.04?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-03-23 18:11:53 UTC
From: aburgh@iastate.edu
Message-ID: <aburgh.732910313@vincent1.iastate.edu>
Source record: 39787

A few weeks ago I installed the PD overscan available on a.a and quickly became very fond of the large screen. Currently I'm using MiNT .96 with overscan and I'd like to move up to .99 or 1.04, but so far I haven't been able to get either to work with overscan. If I don't switch on overscan both versions work, but, when I try to boot with overscan, both versions cause the system to reset. Has anyone been able to get a similar setup to work?

Also, the 'changes' document included with MiNT 1.04 says that anything appearing after mint.prg in the auto folder will be run, but when I resorted my auto folder, nothing after mint was installed. Do I need to do something different?

Thanks,

Aaron
aburgh@iastate.edu

I really doubt, that the letters A to Z are used with the ALT key as a
character modifier in any country.

>perfectly accurate. Then if we take, instead of the simlest possible example,
>a real-life example (in this case, a snippet from some GCC docs, the
>subject in question in the original message), you see:

Your original argument was that TeX documents do not contain plain ASCII, which is obviously false.

A while back you made a comment about GNU being a way of life - that's pretty much true. Kind of like Unix being a way of life - if we were talking about a typical Unix system of 5 years ago or so, everything would have been done in roff. Roff source files are plain ASCII, with embedded control sequences, which are then processed by either troff for typeset proportional spaced output, or nroff for dumb printer output. If we were taking a set of Unix utilities and using them on the Atari, it would be natural to expect that only roff-format documentation would be provided, and you would probably be complaining that the Unix way of life forces you to get nroff or groff running on your system just to be able to read the docs.

The GNU project definitely has some far-reaching goals; trying to duplicate all of the features and programming tools of a Unix system but doing it better and for free involves quite a lot of activity. The Free Software Foundation has chosen TeX for their document typesetter because it is freely available. The texinfo formatting language is pretty much equivalent to roff, you can process the texinfo source to get typesetter output or to get online readable documentation, but there are no strange ASCII control characters in the source. As another post points out, the online-readable stuff is generally intended to be read in emacs, and using emacs is undeniably going to force you to adopt a certain computing lifestyle.

However, there is also a standalone info reader that provides all the benefits of the texinfo document system. In my opinion, the texinfo format is quite superior to the Unix man-page system, because it is a hypertext system, allowing easy access to cross-references, related topics, etc...

Personally, I feel that efficiency is a good enough reason to do things a certain way. I agree with you on most of the points you've raised. I was tripped up the first time I tried to use the GCC GEM library because some declarations used there didn't match what I'd expected based on the documentation I had on hand.

>my libraries need to support everyone, no matter what compiler they choose.

I don't think this issue is as important as you make it out to be. If you simply use shorts for everything in your library code, then all you have to do is provide your library and your header file. People who use GCC who also need to use a portable GEM library can simply replace the GCC-provided header files and library with yours. There's nothing special about the code that accompanies GCC, and no reason to think that it's cast in brass just because it's accompanying the compiler.

>> One person fed me a line about int being "the natural word size..." and
>> thus the proper datatype to use. Frankly, I consider that to be dogmatic

That person was missing part of the argument - the natural word size should only be used when the actual word is not required to be of any particular size. I.e., if you want a simple integer variable but you don't care what size it is (maybe you're only counting from 1 to 4 or something) then you use "int". But when you're trying to deal with items that already have a defined size, then you should use the data type that has the matching size. If GEM data types are always going to be 16 bit integers, then you should always use the type that always represents 16 bit integers in your compiler.

(Btw, as a footnote, the Mark Williams C manual *does* reference a machine that uses 8 bits for its type "short". Check out the lexicon entry on data types and sizes...)

>> twaddle; doubly so because the person refused to cite any reasons or
>> background for such a statement. If the use of the 'int' type carries

>In 'The C Programming Language' Kernighan & Ritchie state:
>"The intent is that short and long should provide different lengths of
>integers where practical; int will normally reflect the most "natural"
>size for a particular machine. As you can see, each compiler is free to
>interpret short and long as appropriate for its own hardware. About all
>you should count on is that short is no longer than long."

Given this background, I think it might be best to define a type of our own (like GWORD which was already suggested), and not use int or short anywhere at all for GEM calls. The usage should really be guided by this - are you writing to adhere to some already-defined system specification, or are you writing completely standalone code? If the code is completely standalone then you can of course use whatever types/sizes you want. But if you have to deal with a low-level system interface, then you have to conform exactly.

>Your original argument was that TeX documents do not contain plain ASCII,
>which is obviously false.

Ummm, well, no. It was never my statement that TeX docs contained non-ascii characters. In fact, since ascii is all characters between 0-127 inclusive no statement like that was made by anyone. Someone else made the statement that the docs contained "control characters". If that person meant characters for which isprint() would be false, I guess that was a wrong statement. If (as seems more likely) that person meant that the docs contain control sequences that make it difficult to read the docs without processing them, I'd have to agree.

My original statement was that TeX-format docs weren't very helpful to someone who doesn't have the facilities for processing them. I stand by that statement, in that you can (with practice) learn to read around the control information, but it isn't easy or convenient.

>just because it's accompanying the compiler.

I think this is another possible area of confusion. GemFast started its life as a set of GEM bindings for a single compiler, Sozobon. As it aged, I began adding higher-level utilities to the library, and supporting other compilers such as MWC, Laser C, and Turbo C. In the v1.8 release a few months ago, the high-level part of the library blossomed into nearly a hundred functions.

So now GemFast is really two things: Under Sozobon/HSC it includes a set of low-level GEM bindings. Under other compilers it is just a library of high-level functions to simplify GEM programming. For non-HSC compilers, the library doesn't include bindings, it rides on top of whatever bindings system is supplied by the compiler vendor.

When I bought Lattice C a few months ago, I spent some time making a very clean split in GemFast between the low and high level parts of the library, to enhance this concept that it rides on top of the existing bindings. My thoughts at that time were that this would make support under GNU C a breeze when I got around to it, since I (erroniously) assumed the GCC bindings would be implemented the same as the Lattice C bindings. (GCC and Lattice are both ANSI compilers. They both support either 16 or 32 bit ints. So I assumed they'd take the same route in GEM binding support.)

What you are saying, I guess, is that it is up to me to rewrite the GCC GEM bindings, and make them a part of GemFast as implemented for GNU C. This I can certainly do, although it will take a while. (I think I've cooked up an interim solution that will allow folks to use GemFast with the existing bindings as long as they use -mshort. This will let folks start using GemFast right away while I work over the bindings for 32-bit mode.)

The real question I'm asking is: Do y'all WANT me to do this? If I spend time working everything over to use an interface built around the short datatype, it'll be a vast waste of time if everyone decides that's the wrong solution and they really want an interface built around the int datatype. (If folks decide the latter, we're gonna have to send a blitz of email to HiSoft and Atari lobbying for a change in the Lattice interface. Or, we just write off Lattice users altogether. Since I'm a Lattice user, I don't think much of that idea, to tell the truth. :-)

The login and logout programs should be pretty simple, you don't need to kill GEM after logging out. All that's required is a small GEM application that uses wind_update to lock the screen, thus disabling access to the menu bar and preventing it from being bypassed. In the new AES there is an AP_TERM message you can send to request that an application terminate itself. You can get the list of AES processes with an appl_search call.
You can also ask the AES to do a "shutdown" and it'll send the AP_TERM message to all the active applications and accessories.

So, you set this gemlogin program as the startup application, it simply does a wind_update(BEG_UPDATE) to lock the screen and sits around waiting for someone to try to log in. After a successful login it exits to the desktop.

Your gemlogout program will just need to use appl_search or maybe the shutdown facility, kill off any stragglers, and then invoke gemlogin.

>GEM as process that will later terminate, but sort of continues the
>startup procedure.

no it doesn't continue the startup process. bootgem just runs the GEM
which is in the roms or rather the program that sits in the exec_os
vector... it's possible to hit ctrl-z on the desktop and get back to the
shell which was used to start gem... GEM is started like any other process
except that GEM never ends...

>There are, I think, several ways round this, or at least faking the
>situation. The easiest would perhaps be to wait for multiTos. This may
>(or may not) solve the problem.

it doesn't. you can stop the desktop in multitos, but then you get to a
thing called screen, where you can run any program or restart the desktop...
With multitos you don't need bootgem anymore. You can run gem.sys from
your shell.

yes, I have. you will have to fool mint to think that it is running on a graphics board which doesn't allow setscreen. this can easily be done by changing mem.c where it checks for the screensize (if I remember right... look in the sourcecode for 'scrnsize'...) mint1.04 should have solved the problem, but as the overscan software has a so called physbase emulator, there is no way for mint to find out if setscreen is possible or not...

It certainly is if it can't run on a base Falcon. AmigaDOS and OS/9 can
run on a 68000 machine with no problems.. MultiDOS should be able to do
the same if it is to be considered "efficient".

>But you just shouldn't expect of it what simply can not be done. The Falcon
>is a wonderful machine, but multitasking on it probably asks a bit too much

Actually, Atari has finally started selling their developers' documentation separately from developer program registration.

They have several different packages available, one of which included the "HitchHikers Guide to the BIOS"... their developers' software is available this way too.

Probably the best way to get the current package descriptions and prices would be to call Atari directly. (I don't know if Atari U.K. has a similar program, but it might be worth a call to them...)

I don't have a current number for Gail, but the main Atari phone number is: (408) 745-2000

They should be able to connect you to Developers' Support...

>That sounds kinda silly to me. Of course it's logical to make a long 64-bit if
>the CPU can handle such numbers efficiently but what's the use of making
>ALL types 64-bit? Why not make char 8-bit, short 16-bit and int 32-bit?
>That way you have it all...

The reason to use 64 bit for an int is obvious: an int should represent
the "natural word size" on the machine. For a 64 bit machine (which has
difficulty accessing 32 bit units) an 32 bit int seems natural.

A reason to use short and char types in a program is to save memory
when the program is run. When accessing different sizes as the `natural
machine word` is very difficult on a certain machine, it may be a wise
